# **Outline of the Course**

# 1. Course description, goals, objectives, and learning outcomes

The academic discipline "Algorithms and methods of calculations" is designed to provide basic mathematical training of students in the field of methods for solving scientific and engineering problems and programming, taking into account the peculiarities of the algorithmic implementation for numerical methods.

The subject "Algorithms and methods of calculations" has the code PO9 in the list of components of the educational program and belongs to the cycle of professional training.

Within the first part of the course the concept of algorithm, basic properties and types of algorithms are considered, three main types of universal algorithmic models are studied: recursive functions, Turing machine and normal Markov algorithms.

The second part of the course studies methods of the table function interpolation, methods for solving nonlinear equations, basic properties of matrices, vectors and determinants, methods for solving systems of linear algebraic equations, approximate calculation of integrals, numerical solution of Cauchy problem for ordinary differential equations and numerical methods for solving boundary value problems for differential equations with partial derivatives.

The purpose of the "Algorithms and methods of calculations" course is study of modern methods and technologies for developing and evaluating algorithms, fundamental training of students in choosing and using algorithm methods. The calculation methods should be resistant to errors, effective for calculating mathematical problems, analysis of approximate solutions, creating highly efficient algorithms and programs that take into account the peculiarities of the implementation of calculations, and promoting the development of logical and analytical thinking of students.

The subject of the academic discipline consists of:

- methods of algorithm analysis;

- methods for determining the computability and solvability of functions;
- Numerical methods for solving mathematical problems.

According to the requirements of the educational program, students after mastering the credit module must demonstrate the following learning outcomes:

**Knowledge:** basic calculation methods and corresponding effective algorithms for solving mathematical problems on a PC; calculation of approximate values and interpolation of functions, solution of systems of linear algebraic equations and nonlinear equations, numerical integration and differentiation, solution of differential equations with choice of method. Use of splines in interpolation of tables of values of functions and calculation of integrals. Analysis and processing of experimental results and a posteriori estimates of errors.

**Ability** to choose and justify the use in practice of certain calculation methods that are resistant to errors and most effective in their practical implementation on a PC.

**Experience:** the student must know the basic principles of developing algorithms and software for solving problems on a PC. He should have skills to explore computational algorithms, identify their advantages and disadvantages, choose the optimal algorithms for solving problems, data processing and develop programs for solving problems; perform analysis and processing of the results of problem solving, use optimization methods, a posteriori estimates of errors in solving problems by numerical methods.

# 2. Prerequisites and post-requisites of the course (the place of the course in the scheme of studies in accordance with curriculum)

The material of the discipline is related to the materials studied in the courses "Higher Mathematics: Differential Calculus, Linear Algebra", "Programming" and "Discrete Mathematics".

The knowledge and practical skills acquired in this discipline can be applied in the study of the following courses: "Computer Modeling", "Fundamentals of Software Engineering", "System Programming", "Distributed Computing Technology", "Network and Information Technology" and other.

#### 3. Content of the course

The "Algorithms and methods of calculations" academic discipline includes the study of the following topics.

#### Section 1. Fundamentals of algorithm theory

#### Topic 1.1. Introduction. Main methods and tasks, connection with other disciplines.

The main sections and issues to be explored. Contents of individual and laboratory works. Features of laboratory work and individual tasks, requirements for them.

Topic 1.2. The concept of algorithm, properties and methods of algorithm setting.

**Topic 1.3. Measures of algorithm complexity**. Problem classes P and NP. Fundamentals of algorithm analysis.

**Topic 1.4. Error. Classification, sources and rules for calculating errors.** Significant cypher, rules for counting numbers according to Bradys, the general formula for error.

**Topic 1.5. Formalization of the concept for algorithm. Universal models of algorithms.** Recursive functions. Primitively recursive functions. Superposition operator. Primitive recursion operator. Partially recursive functions. Minimization operator.

**Topic 1.6. Turing machine**. Functions, which are calculated by Turing.

**Topic 1.7. Normal Markov algorithms. Equivalence of different universal algorithmic models. Markov substitutions.** Normal algorithms that use words. Computed Markov function. The principle of Markov normalization. Coincidence of the class of all normally computed functions with the class of all functions computed by Turing.

### Section 2. Fundamentals of numerical methods

**Topic 2.1. Interpolation and the problem of interpolation. Generalized polynomials. Interpolation by algebraic polynomials.** Lagrange interpolation polynomial. Lagrange interpolation polynomial for equidistant nodes. Inverse interpolation. Newton interpolation polynomial. Spline interpolation. Trigonometric interpolation.

**Topic 2.2. Methods of numerical differentiation and integration.** General procedure for numerical differentiation. A direct way to calculate a definite integral. Methods for approximate calculation of integrals. Newton-Cotes methods: rectangle method, trapezoidal method, parabola formula (Simpson's formula). Methods of spline integration.

**Topic 2.3. Methods for solving nonlinear equations**. Problem statement, stages of approximate solution of nonlinear equations. The method of half division. Proportional parts method (chord method). Newton method (tangent method). Modified Newton method. Combined method, iteration method, modified iteration method.

**Topic 2.4. Solving systems of linear algebraic equations.** Types of systems of linear algebraic equations. Compatible and incompatible systems of algebraic equations. The set of solutions of a algebraic equation system. The extended matrix of the system of linear algebraic equations. Rank of the matrix (system). Base minor. Kronecker-Capelli theorem. Systems of linear algebraic equations with a square matrix. Homogeneous systems of linear algebraic equations. General solution of an inhomogeneous system of linear equations. Gaussian exclusion method. Gauss-Jordan method. Square root method. Running method.

**Topic 2.5. Iterative methods for solving systems of algebraic equations.** Accurate and iterative methods. General scheme of construction of iterative methods. Construction of the iterative process. Simple iteration method in coordinate form. Modification of the iteration method. A sufficient condition for the convergence of the iteration process in coordinate form. Jacobi method in coordinate form. Gauss-Seidel method in coordinate form. Method of relaxation in coordinate form. Canonical form of recording one-step iterative methods. Generalized solution of a system of linear equations. Stationary and non-stationary one-step methods. Simple iteration method (Jacobi method). Gauss-Seidel method.

**Topic 2.6. Solving systems of nonlinear algebraic equations.** Determining the solution of systems of nonlinear equations. Simple iteration method. Convergence of the iterative process. Checking the convergence condition. Seidel method. Seidel convergence condition. Newton method. Simplified Taylor series for an arbitrary function. Representation of a function by Taylor series. Formation of a matrix of equations. Checking the achievement of accuracy by the iterative process. Algorithm for solving a system of nonlinear equations by Newton method.

**Topic 2.7. Numerical solution of differential equations.** Partial solution of a differential equation. General solution of the differential equation. Cauchy problem (problem with initial data), boundary value problem or problem with boundary conditions. One-step methods. Euler method, refined Euler method. Runge-Kutta method. Multi-step methods. Explicit Adams method (Adams-Bashfort method). Implicit Adams method (Adams-Multon method). Comparison of Adams and Runge-Kutta methods. Prognosis and correction methods (predictor-corrector methods). Prediction and correction method based on the Adams method of the fourth order. Milne method. Hamming method.

**Topic 2.8. Numerical methods for solving the boundary value problem for the ordinary differential equation (ODE)**. Finite-difference method for solving a boundary value problem with boundary conditions of the first kind. Finite-difference method for solving a boundary value problem with boundary conditions of the third kind. Approximation of the differential equation by finite differences in general, approximation of boundary conditions. Running method for solving systems with a three-diagonal matrix.

**Topic 2.9. Solving partial differential equations**. Classification of differential equations with partial derivatives, types of equations (elliptical, parabolic, hyperbolic, mixed). The concept of the method of finite differences. Applying the finite difference method to solving parabolic equations. Finite-difference approximation of equations of hyperbolic type. Finite-difference approximation of the third boundary value problem for the Poisson equation in a rectangle. Solving the Dirichlet problem by the grid method (finite difference method).

**Topic 2.10. Iterative asynchronous methods.** Method of asynchronous iterations. Method of asynchronous iterations with fixed points.

|-----|--|
| з/п |  |
| 1   | Introduction. Methods and tasks of the course, connection with other disciplines. The main           |
|     | sections and issues to be explored. Contents of independent and laboratory works. Features of        |
|     | laboratory work and individual tasks, requirements.  |
|     | The concept of algorithm, properties and methods of setting algorithms. Stages of problem            |
|     | solving, algorithm concept (algorithm definition, numerical algorithms, logical algorithms,          |
|     | sequential algorithms, parallel algorithms). General properties of algorithms (discreteness, mass,   |
|     | determinism, elementary steps, efficiency). Ways to set algorithms (verbal, graphical,               |
|     | pseudocode, software). Image of the algorithm in the form of a block diagram (rules of graphic       |
|     | design of the block diagram, linear algorithm, branching algorithm cyclic algorithm).                |
| 2   | Measures of complexity of algorithms. Problem classes P and NP. Fundamentals of algorithm            |
|     | analysis. Computational complexity. Asymptotic notation. Comparison of functions. Principles of      |
|     | selection of classes of function growth. Algorithms of polynomial complexity (class P). Asymptotic   |
|     | complecsity $O(n), O(n^2)$ . Algorithms of nondeterministic polynomial complexity (class of NP       |
|     | problems). Typical tasks. The salesman problem, the coloring of the graph, the problem of the        |
|     | sum of the elements of subsets, the problem of the truth of KNF-forms.                               |
| 3   | Error. Classification, sources and rules for calculating errors. Mathematical model error, input     |
|     | data error, method error, rounding error. Absolute and relative error, the limit of absolute and     |
|     | relative error. Calculation with strict errors. Significant figure, calculation rules without strict |
|     | consideration of errors. Rules for counting numbers according to Bradys, the general formula for     |
|     | error.   |

|-----------------|--|
| <u>з/п</u><br>Л | Internolation and the problem of internolation. Generalized polynomials. Internolation by  |
| -               | algebraic polynomials. Lagrange interpolation polynomial. Lagrange interpolation polynomial for  |
|                 | equidistant nodes. Lagrange interpolation polynomial for non-equidistant nodes. Lagrange   |
|                 | interpolation polynomial error for equidistant nodes. Inverse interpolation.   |
| 5               | Interpolation and the problem of interpolation (continued). Newton interpolation polynomial.   |
|                 | Divvided differences, expressions for divvied differences due to the values of functions. Theorem  |
|                 | on the existence of a Newton polynomial for arbitrarily given nodes. Newton polynomial   |
|                 | advantage, Newton interpolation polynomial error. Finite differences. Newton interpolation   |
|                 | polynomial for equidistant nodes, interpolation polynomial error for equidistant nodes. Spline   |
|                 | interpolation. Trigonometric interpolation. Search for coefficients of a trigonometric polynomial.   |
| 6               | Methods of numerical differentiation and integration. Basic rules of analytical differentiation.   |
|                 | General procedure for applying numerical differentiation. Application of the numerical   |
|                 | differentiation formula based on Newton interpolation polynomial with non-equidistant nodes.   |
|                 | Estimates of errors of numerical differentiation. Numerical differentiation with a Newton  |
|                 | polynomial with equidistant nodes. Abbreviated formulas for approximate differentiation. A   |
|                 | direct way to calculate a definite integral. Methods of approximate calculation of integrals.  |
|                 | Newton-Cotes methods: rectangle method, trapezoidal method, parabola formula (Simpson  |
|                 | formula). Methods of spline integration.   |
| 7               | Methods for solving nonlinear equations. Problem statement, stages of approximate solution of  |
|                 | nonlinear equations. The method of half division. Proportional parts method (chord method).  |
|                 | Newton method (tangent method). Modified Newton method. Combined method, iteration   |
|                 | method, modified iteration method.   |
| 8               | Solving systems of linear algebraic equations. Types of systems of linear algebraic equations.   |
|                 | Compatible and incompatible systems of algebraic equations. The set of solutions of a system of  |
|                 | algebraic equations. The extended matrix of the system of linear algebraic equations. Rank of the  |
|                 | matrix (system). Base minor. Kronecker-Capelli theorem. Systems of linear algebraic equations  |
|                 | with a square matrix. Homogeneous systems of linear algebraic equations. Fundamental system  |
|                 | of solutions of a system of homogeneous linear algebraic equations. General solution of an   |
|                 | inhomogeneous system of linear equations. Gaussian exclusion method. Gauss-Jordan method.  |
| -               | Square root method. Running method.  |
| 9               | <b>Iterative methods for solving systems of algebraic equations.</b> Accurate and iterative methods.   |
|                 | General scheme of construction of iterative methods. Construction of the iterative process.  |
|                 | simple iteration method in coordinate form. Modification of the iteration method. A sufficient   |
|                 | condition for the convergence of the iteration process in coordinate form. Jacobi method in coordinate form. Course Soldel method in coordinate form. Method of relevation in coordinate |
|                 | form. Canonical form of recording one-stop iterative methods. Constrained solution of a system   |
|                 | of linear equations. Stationary and non-stationary one stop methods. Simple iteration method   |
|                 | (lacobi method) Gauss-Seidel method  |
| 10              | <b>Solving systems of nonlinear algebraic equations.</b> Determining the solution of systems of  |
|                 | nonlinear equations. Simple iteration method. Convergence of the iterative process. Jacobi   |
|                 | matrix. Checking the convergence condition. Seidel method. Seidel convergence condition.   |
|                 | Checking the achievement of accuracy by the iterative process. Newton method. Simplified   |
|                 | Taylor series for an arbitrary function. Representation of a function near Taylor. Formation of a  |
|                 | matrix of equations. Checking the achievement of accuracy by the iterative process. Algorithm  |
|                 | for solving a system of nonlinear equations by Newton method. Conditions of convergence of   |
|                 | Newton's method. Verification of convergence conditions for a system of nonlinear equations.   |
| 11              | Numerical solution of differential equations. Partial solution of a differential equation. General   |
|                 | solution of the differential equation. Cauchy problem (problem with initial data), boundary value  |
|                 | problem or problem with boundary conditions. One-step methods. Euler method, refined Euler   |
|                 | method. Runge-Kutta method. Multi-step methods. Explicit Adams method (Adams-Bashfort  |

Markov substitutions. Normal algorithms and their application to words. Normally calculated functions. An example of an algorithm for a computational function in the extended alphabet. The principle of Markov normalization. Coincidence of the class of all normally computed functions with the class of all functions</li> </ul> |

# Self-study

The main task of the cycle of laboratory classes is to provide students with the necessary practical skills to develop algorithms and software for solving computational problems on a PC; research of algorithms in terms of computational complexity, mastering the basic methods and algorithms of interpolation of functions, development of algorithms for solving nonlinear equations and systems of linear algebraic equations.

# Profile for laboratory work

| Nº | The title of laboratory work   | Number of acad. hours |
|----|--|-----------------------|
| 1  | Laboratory work № 1. The concept of algorithm. Setting algorithms in |                       |
|    | the form of block diagrams.  |                       |
|    | - Section 1. Topic 1.1,  | 1                     |
|    | - Section 1. Topic 1.2.  | 1                     |
| 2  | Laboratory work № 2. Computational complexity of sorting             |                       |
|    | algorithms.  |                       |
|    | - Section 1. Topic 1.3,  | 2                     |
|    | - Section 1. Topic 1.4.  | 2                     |
| 3  | Laboratory work № 3. Interpolation of functions. Interpolation       |                       |
|    | polynomials  |                       |
|    | - Section 2. Topic 2.1,  | 2                     |
|    | - Section 2. Topic 2.2.  | 2                     |
| 4  | Laboratory work № 4. Solving nonlinear equations on a computer.      |                       |
|    | - Section 2. Topic 2.3,  | 2                     |
|    | - Section 2. Topic 2.4.  | 2                     |
| 5  | Laboratory work № 5. Solving systems of linear algebraic equations.  |                       |
|    | - Section 2. Topic 2.5,  | 2                     |
|    | - Section 2. Topic 2.6.  | 2                     |

# **Profile for lectures**

# **Policy and Assessment**

# 6. Course policy

During classes in the "Algorithms and methods of calculations" academic discipline students must follow certain disciplinary rules:

• it is forbidden to be late for classes;

• at the entrance of the teacher, as a sign of greeting, persons studying at "KPI Igor Sikorsky" must stand up;

- no extraneous conversations or other noise that interferes with the classes;
- leaving the classroom during the lesson is allowed only with the permission of the teacher.

• it is not allowed to use mobile phones and other technical means without the permission of the teacher.

Laboratory works are handed over personally with preliminary check of the theoretical knowledge, which is necessary for performance of laboratory work. Verification of practical results includes verification of code and performance of test tasks.

During the training, the teacher has the right to receive up to 5 incentive points for early performance of laboratory work, for creative approach in performing an individual task or for active participation in the discussion of issues related to the topic of the lecture or practical lesson.

For the performance and delivery of laboratory work after the specified deadline, for a significant number of missed classes, or for violation of the rules of conduct in the classroom, the teacher may assign up to 5 penalty points.

When conducting control measures and performing laboratory work, graduate students must follow the rules of academic integrity. If a significant percentage of write-offs or plagiarism is detected, the teacher may refuse to accept the work and demand a fair implementation of the curriculum.

# 7. Monitoring and grading policy

At the first class the students are acquainted with the grading policy which is based on Regulations on the system of assessment of learning outcomes <u>https://document.kpi.ua/files/2020 1-273.pdf</u> Types of control in the "Algorithms and methods of calculations" discipline include:

-Laboratory works: laboratory works

- -Current control: testing by closed tests.
- -Final test: closed test or interview with a teacher.
- Bonuses.

Conditions of admission to semester control: semester rating more than 40 points.

At the first class the students are acquainted with the grading policy which is based on Regulations on the system of assessment of learning outcomes <u>https://document.kpi.ua/files/2020 1-273.pdf</u> The student's rating in the course consists of laboratory work scores (R1), current test scores (R2), final test scores (R4) and bonus scores (R4)

### Rs=R1+R2+R3+R4=100 scores

The maximum average weight score is equal to:

## R1=5 labs x 10 points = 50 points

# R2=5 current testpoints x 5 points = 25 points

# R3=Final test=25 points

# R4=from 0 to 10 points for outstanding achievements in learning and completing additional tasks

According to the university regulations on the monitoring of students' academic progress (<u>https://kpi.ua/document control</u>) there are two assessment weeks, usually during 7th/8th and 14th/15th week of the semester, when students take the Progress and Module tests respectively, to check their progress against the criteria of the course assessment policy.

The students who finally score the required number of points (≥60) can:

- get their final grade according to the rating score;
- perform personal test or to pass an interview with the teacher in order to increase the grade.

Students whose final performance score is below 60 points but more than 30 are required to complete personal test or to pass an interview with the teacher. If the final grade is lower than the grade, which the student gets for his semester activity, a strict requirement is applied - the student's previous rating is canceled and he receives a grade based on the results of the Fail/Pass test. Students whose score is below 30 are not allowed to take the Fail/ Pass Test.

The final performance score or the results of the Fail/ Pass Test are adopted by university grading system as follows:

| Score                           | Grade        |
|---------------------------------|--------------|
| 100-95                          | Excellent    |
| 94-85                           | Very good    |
| 84-75                           | Good         |
| 74-65                           | Satisfactory |
| 64-60                           | Sufficient   |
| Below 60                        | Fail         |
| Course requirements are not met | Not Graded   |

# 8. Additional information about the course

Teaching the academic discipline "Algorithms and methods of calculations" for the field of "Computer Engineering" has its own specifics, which is due to the fact that the scope of methods of

machine data analysis is constantly expanding. Widespread informatization leads to the accumulation of huge amounts of data in research, production, transport, and health care. Forecasting, control, and decision-making tasks often require machine data analysis and machine learning, as previously such tasks were either not posed at all or solved by precise methods that required large computing power due to the complexity of the respective algorithms.

Syllabus of the course

Is designed by teacher Doc.Sci,professor Mykhailo Novotaerskyi Adopted by Department of Computing Technics (protocol № 10, date 25.05.22) Approved by the Faculty Board of Methodology (protocol № 10, date 09.06.22)
