# МЕТОДИ ГЛИБОКОГО НАВЧАННЯ

## ЛЕКЦІЯ 1: ВСТУП

Юрій Гордієнко, сертифікований інструктор DLI

DEEP  
LEARNING  
INSTITUTE

# DEEP LEARNING INSTITUTE

Misія DLI

Навчить вас вирішувати  
найскладніші проблеми світу.

- Розробники, спеціалісти з обробки даних та інженери
- Безпілотні автомобілі, охорона здоров'я та робототехніка
- Навчання, оптимізація та розгортання глибоких нейронних мереж

# ВИЗНАЧЕННЯ

## ARTIFICIAL INTELLIGENCE

Early artificial intelligence stirs excitement.

## MACHINE LEARNING

Machine learning begins to flourish.

## DEEP LEARNING

Deep learning breakthroughs drive AI boom.

# ГЛИБКЕ НАВЧАННЯ ЦЕ МІЖ ГАЛУЗЯМИ

Інтернет-сервіси

Ліки

ЗМІ та розваги

Безпека та оборона

Автономні машини

- Класифікація зображення/відео
- Розпізнавання мови
- Обробка природної мови

- Виявлення ракових клітин
- Діабетична оцінка
- Відкриття ліків

- Субтитри до відео
- Пошук на основі вмісту
- Переклад у реальному часі

- Розпізнавання обличчя
- Відеоспостереження
- Кібербезпека

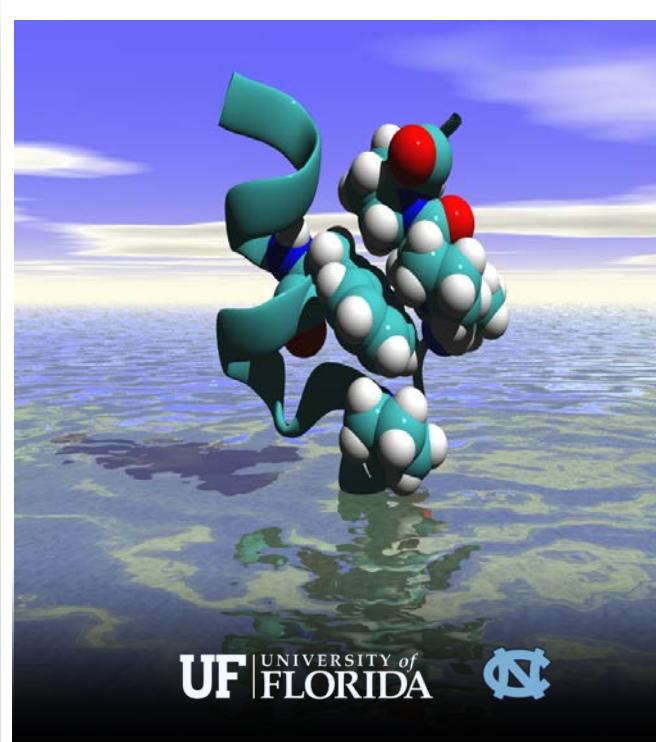

- Виявлення пішоходів
- Відстеження смуги руху
- Розпізнавати дорожні знаки

DEEP  
LEARNING  
INSTITUTE

# Deep Learning Methods - Lecture 2 – Data, Datasets, Exploratory Data Analysis (EDA)

Yuri Gordienko, DLI Certified Instructor

DEEP  
LEARNING  
INSTITUTE

# DEEP LEARNING INSTITUTE

## DLI Mission

Training you to solve the world's most challenging problems.

- Developers, data scientists and engineers
- Self-driving cars, healthcare and robotics
- Training, optimizing, and deploying deep neural networks

# This Lecture Overview

- Understand different types and formats of data
  - Be able to soundly select appropriate data
    - Have awareness of biases that exist
- Be able to refine questions to suite your true inquiry
- Understand how to parse text with regular expressions

# Definitions

# Definitions - Data

- Factual information (such as measurements or statistics) used as a basis for reasoning, discussion, or calculation
  - Information in digital form that can be transmitted or processed
  - Information output by a sensing device or organ that includes both useful and irrelevant or redundant information and must be processed to be meaningful

# Definitions – Datum, Data, Dataset

- **Datum** - A single piece of information, which can be treated as an **observation**;
- **Data** - The plural of datum; multiple observations;
- **Dataset** - A homogenous **collection** of data (each datum must have the same focus)

# Definitions — Data Sources

- Factual information (such as measurements or statistics) used as a basis for reasoning, discussion, or calculation
  - Information in digital form that can be transmitted or processed
  - Information from sensors or organs that includes both useful and irrelevant or redundant information and must be processed to be meaningful

# Definitions — Data Sources - Use Cases

- Measurements from a thermometer every hour for a year
- Counts from a person who tracks the days that a particular hummingbird visits his birdfeeder across an entire year
  - Tweets from Elon Musk
  - Readouts from a mysterious sensor, for example, from [wundergound.com](https://wundergound.com)

# Definitions — Data Sources - Use Cases

- Measurements from a thermometer every hour for a year
  - **Probably inaccurate data**
- Counts from a person who tracks the days that a particular hummingbird visits his birdfeeder across an entire year
  - Tweets from Elon Musk
- Readouts from a mysterious sensor, for example, from [wundergound.com](https://wundergound.com)

# Definitions — Data Sources - Use Cases

- Measurements from a thermometer every hour for a year
  - **Probably inaccurate data**
- Counts from a person who tracks the days that a particular hummingbird visits his birdfeeder across an entire year
  - **Probably missing data**
  - Tweets from Elon Musk
- Readouts from a mysterious sensor, for example, from [wundergound.com](https://wundergound.com)

# Definitions — Data Sources - Use Cases

- Measurements from a thermometer every hour for a year
  - **Probably inaccurate data**
- Counts from a person who tracks the days that a particular hummingbird visits his birdfeeder across an entire year
  - **Probably missing data**
  - Tweets from Trump
  - **Probably not 100% factually true**
- Readouts from a mysterious sensor, for example, from [wundergorund.com](http://wundergorund.com)

# Definitions — Data Sources - Use Cases

- Measurements from a thermometer every hour for a year
  - **Probably inaccurate data**
- Counts from a person who tracks the days that a particular hummingbird visits his birdfeeder across an entire year
  - **Probably missing data**
  - Tweets from Trump
  - **Probably not 100% factually true**
- Readouts from a mysterious sensor, for example, from [wundergorund.com](http://wundergorund.com)

# Data Processing

-

## Workflow

-

## Datasets

# Recall -> Data Processing from Scientific Point of View

Ask an interesting question

Get the Data

Explore the Data

Model the Data

Visualize the Results

# Dataset – Important Questions!

- What data is necessary to **answer** our question?
  - How **difficult** is it to analyze a dataset?
- Is the source **authoritative**? (.com, .net, .org, .gov, .name)
  - **Comprehensive** data vs sampled data?
    - **Biases**
- What is the allowed usage of data under its **license**?
  - **Who** collected the data?
  - **When** was the data collected?
  - **How** was the data collected?
  - **How** is the data **formatted**?
    - **Ethical** issues?

# Dataset – Examples

- Open access data

29 billion words in  
55 million articles in 309  
languages

- Collected and digitized as part of generalized procedures of an institution

~610 million tweets per day

<https://www.internetlivestats.com/twitter-statistics/>

# Dataset – Important Questions!

- What data is necessary to **answer** our question?
  - How **difficult** is it to analyze a dataset?
- Is the source **authoritative**? (.com, .net, .org, .gov, .name)
  - **Comprehensive** data vs sampled data?
    - **Biases**
- What is the allowed usage of data under its **license**?
  - **Who** collected the data?
  - **When** was the data collected?
  - **How** was the data collected?
  - **How** is the data **formatted**?
    - **Ethical** issues?

# Dataset – Common Problems!

- **Omission:** Using only arguments from one side
- **Source selection:** Include more sources or more authoritative sources for one side over the other
- **Story selection:** Regularly including stories that agree or reinforce the arguments of one side
- **Labelling:**
  - Using only arguments from one side
  - Labeling people on one side of the argument with labels and not the other
- **Spin:** Story provides only one interpretation of the events

# Dataset – Common Problems – **IMDb Example**

- Registered users rate films 1-10 stars; they are an **overrepresented subpopulation** relative to the **general population**.
- Registered users who rate movies in their free time **over represents** a specific segment of the **general population**.

Example: “Men Are Sabotaging The Online Reviews Of TV Shows Aimed At Women”

60% who rated “*Sex in the City*” were women.

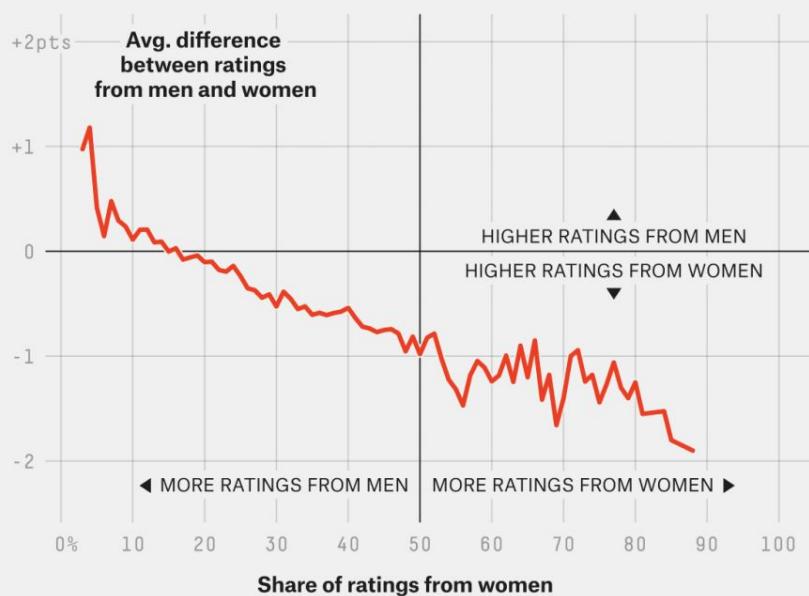

Women gave it a **8.1**, men gave it **5.8**.

# Dataset – Common Problems – IMDb Example

## Men tank the ratings of shows aimed at women

Average difference between IMDb ratings of TV shows from men and women by share of ratings from women

For English language shows with 1,000 or more ratings

FIVETHIRTYEIGHT

BASED ON DATA FROM IMDB

## Men are more likely to give the crappiest rating

Share of IMDb ratings of 1 (out of 10) for shows with at least 10,000 ratings by share of ratings from women\*

\*Rounded to nearest 5 percent

FIVETHIRTYEIGHT

BASED ON DATA FROM IMDB

# Dataset – Common Problems – **Resume**

- Nearly all datasets **involve a human** in some way or another.
- This means that **nearly all** datasets probably has **bias**.
- Our goal: to **minimize the bias** as much as possible.
- For **models** (later), the **same** advice should be applied.

hard for computers

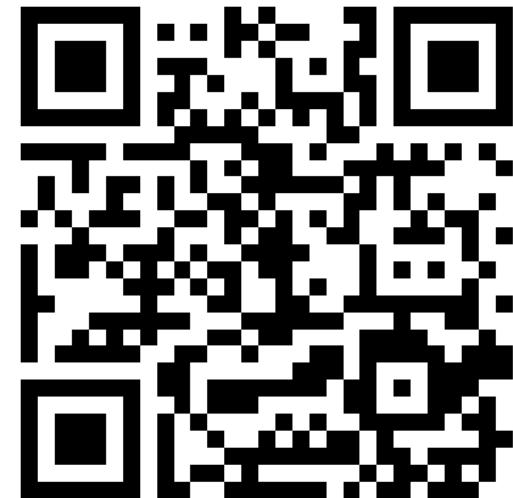

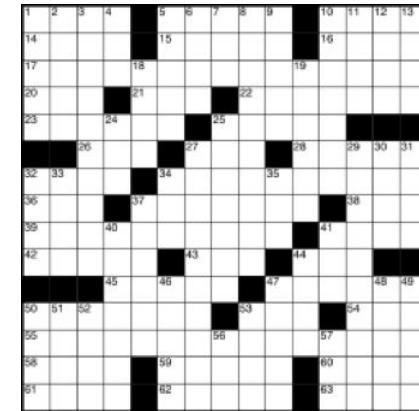

easy for  
computers

hard for computers

	A	B	C
1	name	age	height
2	Michael	46	5'9"
3	Jim	31	6'0"
4	Pam	29	5'7"
5	Meredith	53	5'6"
6	Dwight	35	5'10"

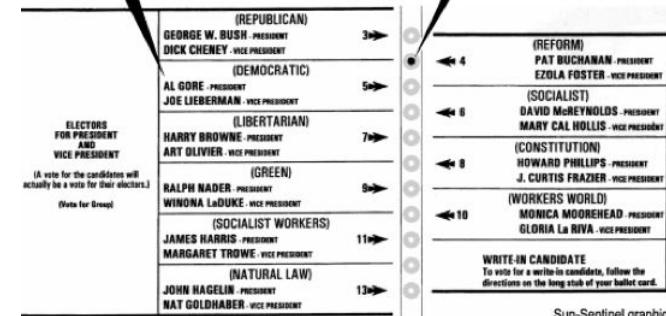

### Confusion at Palm Beach County polls

Some Al Gore supporters may have mistakenly voted for Pat Buchanan because of the ballot's design.

Although the Democrats are listed second in the column on the left, they are the third hole on the ballot.

Punching the second hole casts a vote for the Reform party.

Sun-Sentinel graphic

easy for people

hard for people

# Dataset – Easy vs. Hard

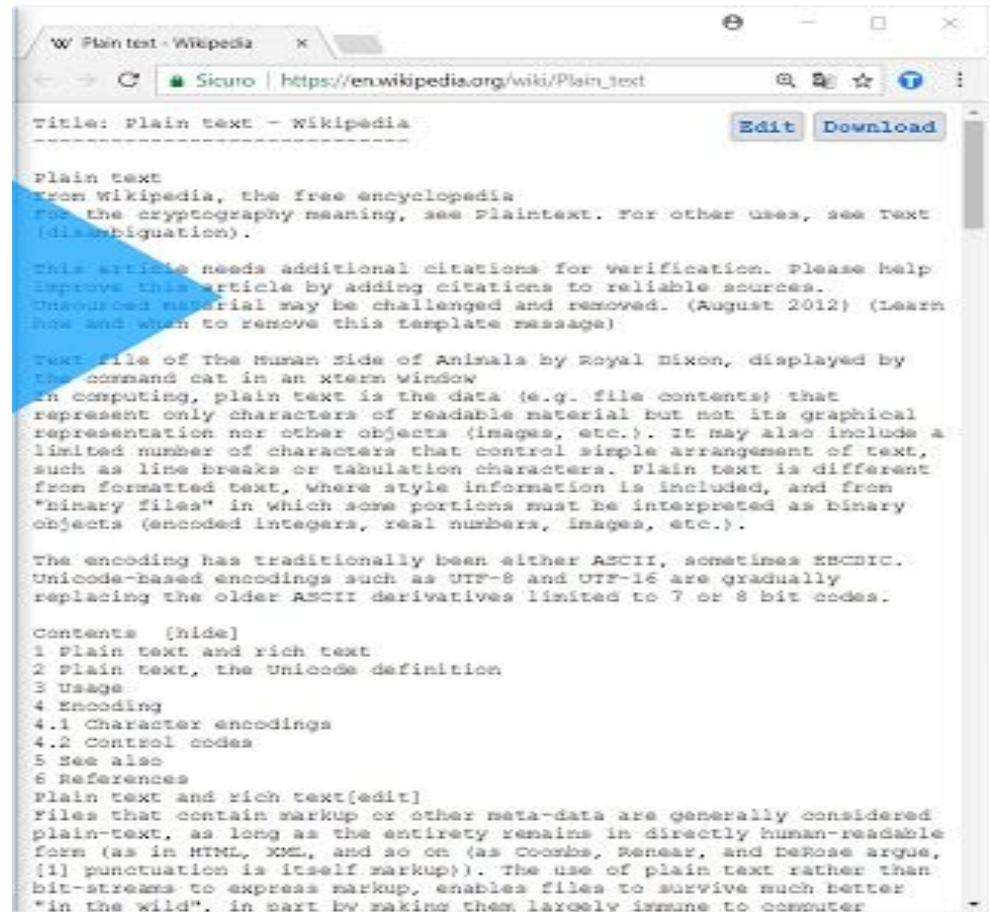

Computers are better at ‘understanding’ photos and videos, and text and numbers are much easier.

**Why?**

**Structured** data (e.g., spreadsheet formatted data)  
is much easier than  
**unstructured** data (e.g., free-flowing essays)

# Dataset – Text Formats - Plain

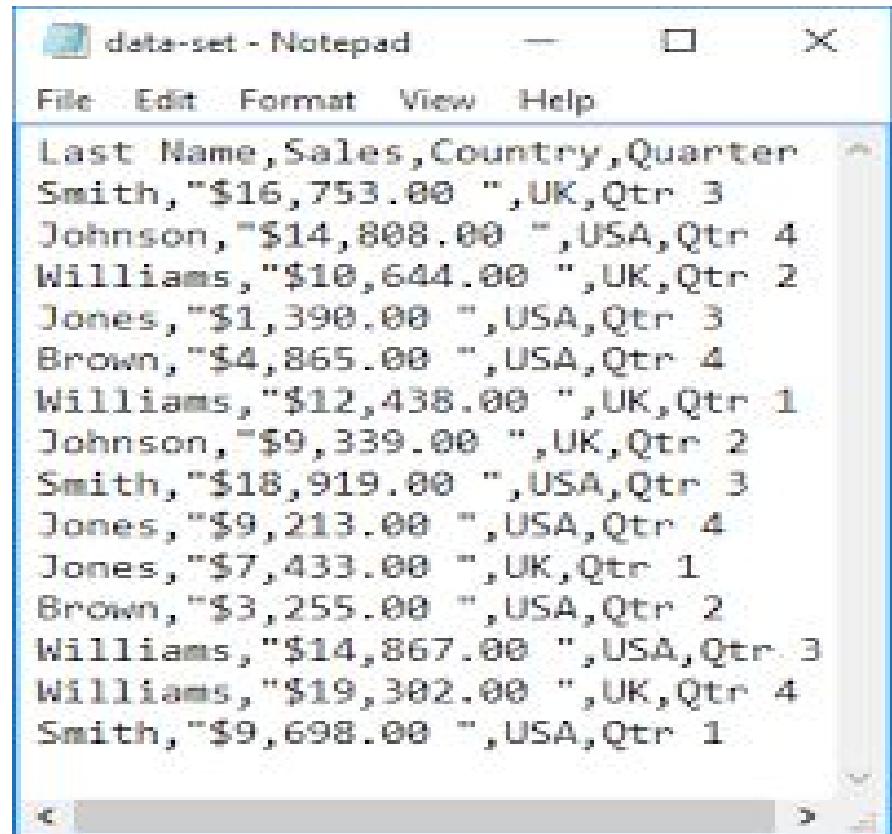

- File extension ends in .txt (generally)
- **No formatting:** font type, font size, color, etc.
- **Text is delimited** (position provided) by whitespace characters (space, tab, return)

# Dataset – Text Formats - Plain

Delimiter: The character that separates each value

- Comma-separated (.csv)
- Tab-separated (.tsv)

The screenshot shows a Windows Notepad window with the title "data-set - Notepad". The window contains a plain text dataset with 15 rows of comma-separated values. The columns are labeled "Last Name", "Sales", "Country", and "Quarter". The data includes names like Smith, Johnson, Williams, and Jones, along with their sales figures and the quarter they belong to.

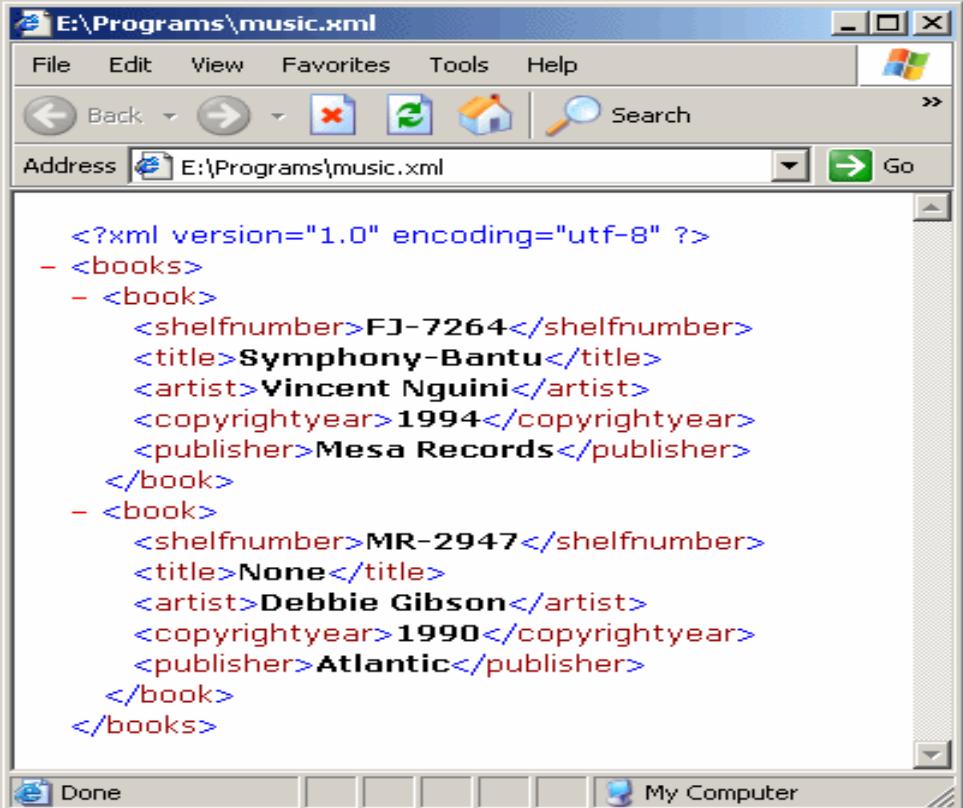

Last Name	Sales	Country	Quarter
Smith	\$16,753.00	UK	Qtr 3
Johnson	\$14,808.00	USA	Qtr 4
Williams	\$10,644.00	UK	Qtr 2
Jones	\$1,390.00	USA	Qtr 3
Brown	\$4,865.00	USA	Qtr 4
Williams	\$12,438.00	UK	Qtr 1
Johnson	\$9,339.00	UK	Qtr 2
Smith	\$18,919.00	USA	Qtr 3
Jones	\$9,213.00	USA	Qtr 4
Jones	\$7,433.00	UK	Qtr 1
Brown	\$3,255.00	USA	Qtr 2
Williams	\$14,867.00	USA	Qtr 3
Williams	\$19,302.00	UK	Qtr 4
Smith	\$9,698.00	USA	Qtr 1

# Dataset — Text Formats - XML

Extensible Markup Language (XML) is a markup language that defines a set of rules for encoding documents in a format that is both human-readable and machine-readable.

## XML (.xml)

The colors aren't actually stored in the file, the editor just adds them on your screen to help make it look prettier.

A screenshot of a Windows-style file viewer window titled "E:\Programs\music.xml". The window has a standard menu bar with File, Edit, View, Favorites, Tools, and Help. Below the menu is a toolbar with Back, Forward, Stop, Refresh, Home, and Search buttons. The address bar shows "E:\Programs\music.xml". The main content area displays the XML code:

```
<?xml version="1.0" encoding="utf-8" ?>
- <books>
  - <book>
    <shelfnumber>FJ-7264</shelfnumber>
    <title>Symphony-Bantu</title>
    <artist>Vincent Nguini</artist>
    <copyrightyear>1994</copyrightyear>
    <publisher>Mesa Records</publisher>
  </book>
  - <book>
    <shelfnumber>MR-2947</shelfnumber>
    <title>None</title>
    <artist>Debbie Gibson</artist>
    <copyrightyear>1990</copyrightyear>
    <publisher>Atlantic</publisher>
  </book>
</books>
```

# Dataset – Text Formats - JSON

JSON (JavaScript Object Notation) is an open standard file format, and data interchange format, that uses human-readable text to store and transmit data objects consisting of attribute-value pairs and array data types.

```
{  
    hey: "guy",  
    anumber: 243,  
    - anobject: {  
        whoa: "nuts",  
        - anarray: [  
            1,  
            2,  
            "thr<h1>ee"  
        ],  
        more: "stuff"  
    },  
    awesome: true,  
    bogus: false,  
    meaning: null,  
    japanese: "明日がある。",  
    link: http://jsonview.com,  
    notLink: "http://jsonview.com is great"  
}
```

- Like XML, data is annotated
- A nesting of key-value pairs
- Can be more space efficient than XML

# Dataset – Text Formats - Resume

- They can all express the same content
- Plain Text doesn't have structure, but is universally robust
  - XML is the most verbose, harder to parse
  - JSON doesn't have </stuff\_here> end tags
  - JSON is more succinct than XML (easier to parse)

# Data Processing

-

## Workflow

-

## Starting Question

# Recall -> Data Processing from Scientific Point of View

Ask an interesting question

Get the Data

Explore the Data

Model the Data

Visualize the Results

# Starting Question – Concrete

- It's crucial for your starting question (**assumption**) of data research to have **concrete defined terms that can be proven true or false.**
  - **Assumption:** “Voting turnout is high”
    - Where? Ukraine? World-wide?
    - What type of voting? Presidential races, local elections?
  - What is our metric? Number of total votes. Percentage of the population?
    - What's our actual time scale?

# Starting Question — Resume

- The **more specific** your questions, the **more meaningful** your results can be.
- Aware of **biases** (both in your data and in your modelling) as much as you can. Doing so will ensure you are providing results that **accurately represent reality**, leading to more equitable interpretations and uses of your work.
- This is immensely important, ... for Data Science will **only continue to play** an increasingly powerful and **influential role** in our society and world at large.

# Data Processing

-

## Workflow

-

## Parsing Data

# Where do data come from?

- **Internal sources:** already collected by or is part of the overall data collection of your organization.  
For example: business-centric data that is available in the organization data base to record day to day operations; scientific or experimental data.
- **Existing External Sources:** available in ready to read format from an outside source for free or for a fee.  
For example: public government databases, stock market data, Yelp reviews, [your favorite sport]-reference.
- **External Sources Requiring Collection Efforts:** available from external source but acquisition requires special processing.  
For example: data appearing only in print form, or data on websites.

# Ways to gather online data

- How to get data generated, published or hosted online:
- **API (Application Programming Interface)**: using a prebuilt set of functions developed by a company to access their services. Often pay to use. For example: Google Map API, Facebook API, Twitter API
- **RSS (Rich Site Summary)**: summarizes frequently updated online content in standard format. Free to read if the site has one. For example: news-related sites, blogs
- **Web scraping**: using software, scripts or by-hand extracting data from what is displayed on a page or what is contained in the HTML file (often in tables).

# Web scraping

- **Why do it?** Older government or smaller news sites might not have APIs for accessing data, or publish RSS feeds or have databases for download. Or, you don't want to pay to use the API or the database.
- You just want to explore: Are you violating their terms of service? Privacy concerns for website and their clients?
- You want to publish your analysis or product: Do they have an API or fee that you are bypassing? Are they willing to share this data? Are you violating their terms of service? Are there privacy concerns?

# Types of data

- What kind of values are in your data (data types)?
- 
- Simple or atomic:
- **Numeric:** integers, floats
- **Boolean:** binary or true false values
- **Strings:** sequence of symbols

# Types of data - 2

- What kind of values are in your data (data types)? Compound, composed of a bunch of atomic types:
- **Date and time:** compound value with a specific structure
- **Lists:** a list is a sequence of values
- **Dictionaries:** A dictionary is a collection of key-value pairs, a pair of values  $x : y$  where  $x$  is usually a string called the key representing the “name” of the entry, and  $y$  is a value of any type.
- Example: Student record: what are  $x$  and  $y$ ?
- First: Kevin
- Last: Rader
- Classes: [CS-109A, STAT139]

# Data storage

- How is your data represented and stored (data format)?
- **Tabular Data:** a dataset that is a two-dimensional table, where each row typically represents a single data record, and each column represents one type of measurement (csv, dat, xlsx, etc.).
- **Structured Data:** each data record is presented in a form of a [possibly complex and multi-tiered] dictionary (json, xml, etc.)
- **Semistructured Data:** not all records are represented by the same set of keys or some data records are not represented using the key-value pair structure.

# Tabular Data

- In tabular data, we expect each record or observation to represent a set of measurements of a single object or event.

## First Look At The Data

```
In [27]: hubway_data = pd.read_csv('hubway_trips.csv', low_memory=False)  
hubway_data.head()
```

Out[27]:

	seq_id	hubway_id	status	duration	start_date	strt_statn	end_date	end_statn	bike_nr	subsc_type	zip_code	birth_dz
0	1	8	Closed	9	7/28/2011 10:12:00	23.0	7/28/2011 10:12:00	23.0	B00468	Registered	'97217	1976.0
1	2	9	Closed	220	7/28/2011 10:21:00	23.0	7/28/2011 10:25:00	23.0	B00554	Registered	'02215	1966.0
2	3	10	Closed	56	7/28/2011 10:33:00	23.0	7/28/2011 10:34:00	23.0	B00456	Registered	'02108	1943.0
3	4	11	Closed	64	7/28/2011 10:35:00	23.0	7/28/2011 10:36:00	23.0	B00554	Registered	'02116	1981.0
4	5	12	Closed	12	7/28/2011 10:37:00	23.0	7/28/2011 10:37:00	23.0	B00554	Registered	'97214	1983.0

# Tabular Data

- Each type of measurement is called a **variable** or an **attribute** of the data (e.g. `seq_id`, `status` and `duration` are variables or attributes). The number of attributes is called the **dimension**. These are often called **features**.
- We expect each table to contain a set of **records** or **observations** of the same kind of object or event (e.g. our table above contains observations of rides/checkouts).

```
In [27]: hubway_data = pd.read_csv('hubway_trips.csv', low_memory=False)
hubway_data.head()
```

Out[27]:

	seq_id	hubway_id	status	duration	start_date	strt_sttn	end_date	end_sttn	bike_nr	subsc_type	zip_code	birth_d
0	1	8	Closed	9	7/28/2011 10:12:00	23.0	7/28/2011 10:12:00	23.0	B00468	Registered	'97217	1976.0
1	2	9	Closed	220	7/28/2011 10:21:00	23.0	7/28/2011 10:25:00	23.0	B00554	Registered	'02215	1966.0
2	3	10	Closed	56	7/28/2011 10:21:00	23.0	7/28/2011 10:25:00	23.0	B00456	Registered	'02108	1943.0

# Data Types

- We'll see later that it's important to distinguish between classes of variables or attributes based on the type of values they can take on.
- **Quantitative variable:** is numerical and can be either:
- **discrete** - a finite number of values are possible in any bounded interval. For example: "Number of siblings" is a discrete variable
- **continuous** - an infinite number of values are possible in any bounded interval. For example: "Height" is a continuous variable
- **Categorical variable:** no inherent order among the values  
For example: "What kind of pet you have" is a categorical variable

# Data Processing

---

## Workflow

---

### Exploration Data Analysis: Common Issues

# Common Issues

- Common issues with data:
- **Missing** values: how do we fill in?
- **Wrong** values: how can we detect and correct?
- **Messy** format
- **Not usable**: the data cannot answer the question posed

# Messy Data

The following is a table accounting for the number of produce deliveries over a weekend.

What are the variables in this dataset?

What object or event are we measuring?

	Friday	Saturday	Sunday
Morning	15	158	10
Afternoon	2	90	20
Evening	55	12	45

What's the issue?

How do we fix it?

# Messy Data

We're measuring individual deliveries; the variables are Time, Day, Number of Produce.

	Friday	Saturday	Sunday
Morning	15	158	10
Afternoon	2	90	20
Evening	55	12	45

Problem: each column header represents a single value rather than a variable.

Row headers are “hiding” the Day variable. The values of the variable, “Number of Produce”, is not recorded in a single column.

# Fixing Messy Data

We need to reorganize the information to make explicit the event we're observing and the variables associated to this event.

ID	Time	Day	Number
1	Morning	Friday	15
2	Morning	Saturday	158
3	Morning	Sunday	10
4	Afternoon	Friday	2
5	Afternoon	Saturday	9
6	Afternoon	Sunday	20
7	Evening	Friday	55
8	Evening	Saturday	12
9	Evening	Sunday	45

# Common Causes of Messiness

- Column headers are values, not variable names
- Variables are stored in both rows and columns
- Multiple variables are stored in one column/entry
- Multiple types of experimental units stored in same table
- In general, we want each file to correspond to a dataset, each column to represent a single variable and each row to represent a single observation.
- We want to **tabularize** the data. This makes Python happy.

# Data Processing

---

## Workflow

---

**Data Exploration:  
Descriptive Statistics**

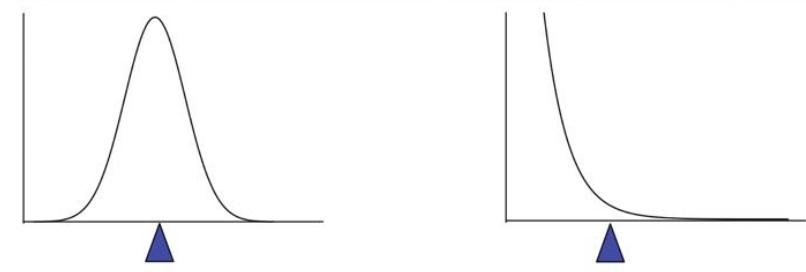

# Basics of Sampling

- A **population** is the entire set of objects or events under study. Population can be hypothetical “all students” or all students in this class.
- A **sample** is a “representative” subset of the objects or events under study. Needed because it’s impossible or intractable to obtain or compute with population data.
  - Biases in samples:
- **Selection bias:** some subjects or records are more likely to be selected
- **Volunteer/nonresponse bias:** subjects or records who are not easily available are not represented

# Sample - Mean

The **mean** of a set of  $n$  observations of a variable is denoted and is defined as:

$$\bar{x} = \frac{x_1 + x_2 + \dots + x_n}{n} = \frac{1}{n} \sum_{i=1}^n x_i$$

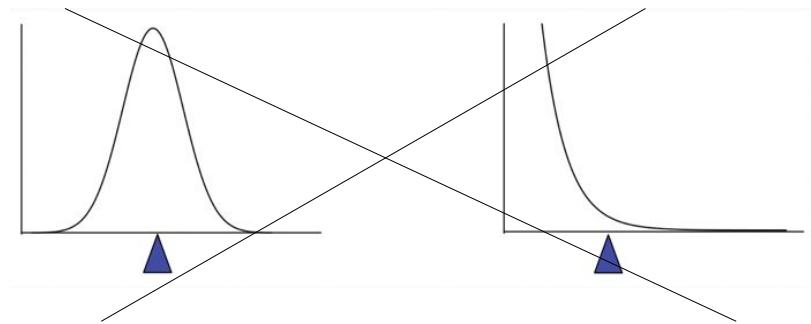

The **mean** describes what a “typical” sample value looks like, or where is the “center” of the distribution of the data.   
Note: there is always uncertainty involved when calculating a sample mean to estimate a population mean.

# Sample - Median

The **median** of a set of  $n$  number of observations in a sample, ordered by value, of a variable is defined by

$$\text{Median} = \begin{cases} x_{(n+1)/2} & \text{if } n \text{ is odd} \\ \frac{x_{n/2} + x_{(n+1)/2}}{2} & \text{if } n \text{ is even} \end{cases}$$

Example (already in order):

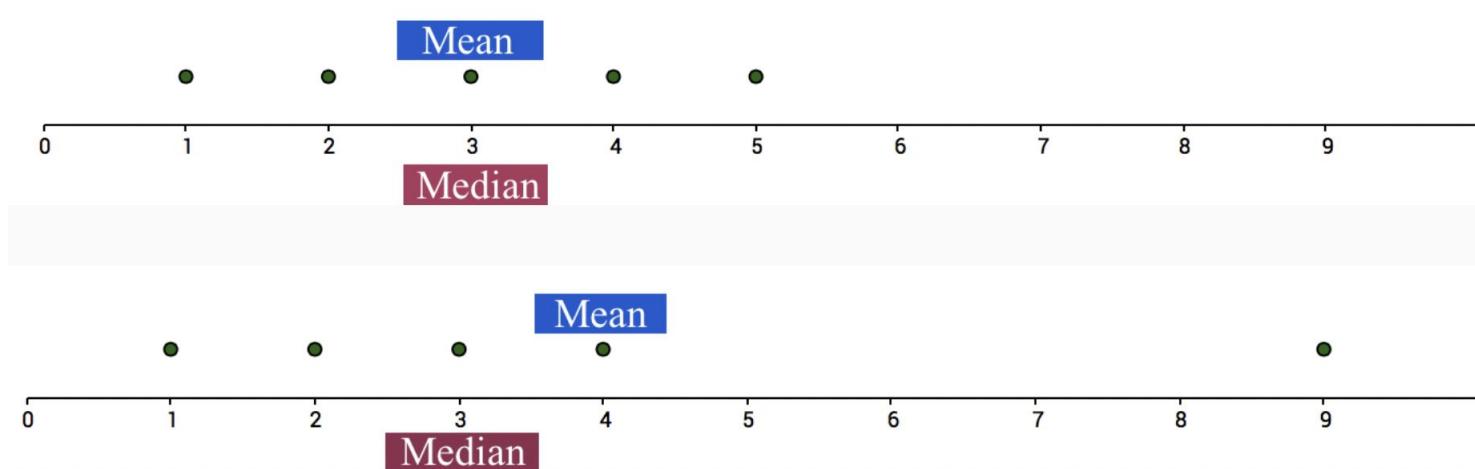

Ages: 17, 19, 21, 22, 23, 23, 23, 38

$$\text{Median} = (22+23)/2 = 22.5$$

The median also describes what a typical observation looks like, or where is the center of the distribution of the sample of observations.

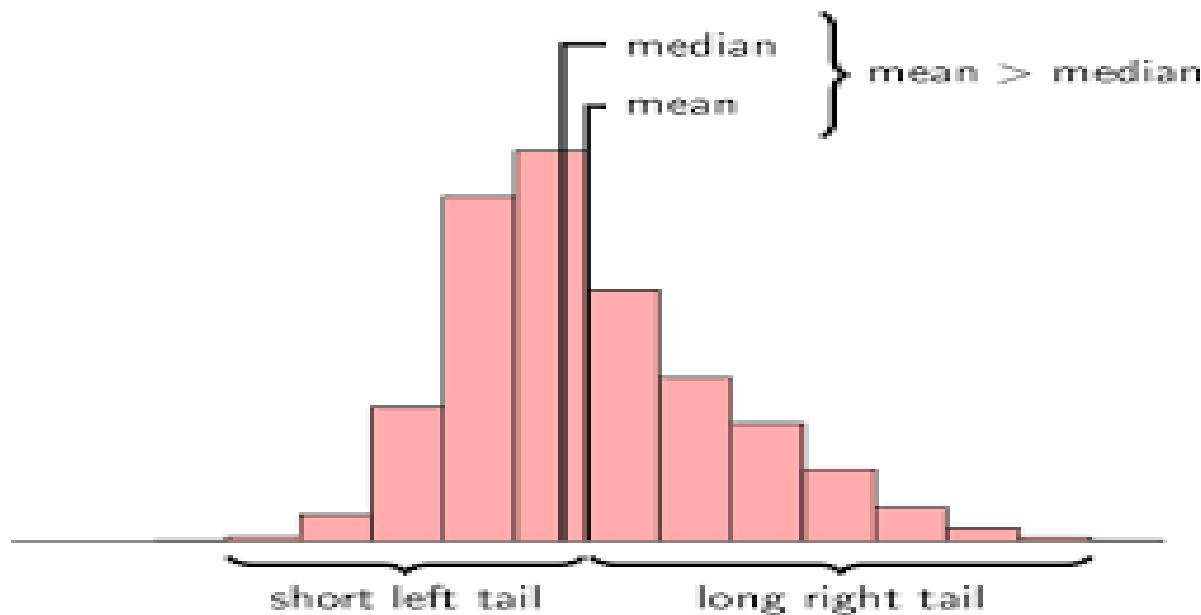

# Sample - Mean vs. Median

The mean is sensitive to extreme values (**outliers**)

# Mean, median, and skewness

The mean is sensitive to outliers:

The above distribution is called **right-skewed** since the mean is greater than the median. Note: **skewness** often

# Computational time

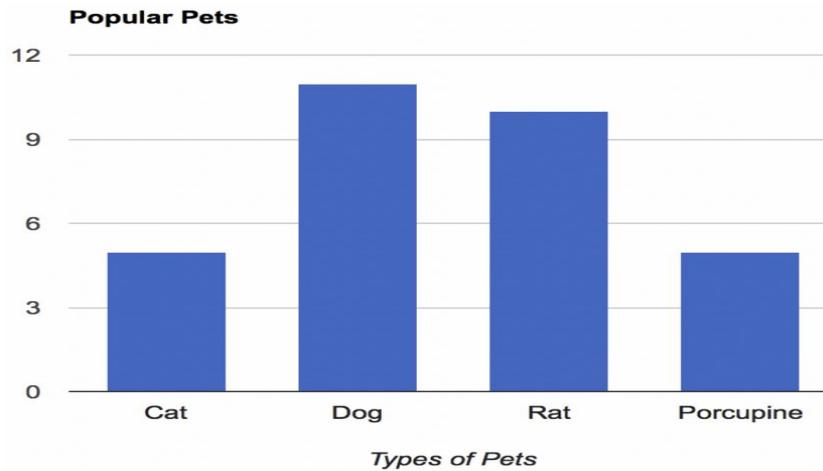

How hard (in terms of algorithmic complexity) is it to calculate  
the **mean**?  
at most  $O(n)$

the **median**?  
at most  $O(n)$  or  $O(n \log n)$

Note: Practicality of implementation should be considered!

# Categorical Variables

For categorical variables, neither mean or median make sense. Why?

The mode might be a better way to find the most “representative” value.

# Measures of Spread: Range

The spread of a sample of observations measures how well the mean or median describes the sample.

One way to measure spread of a sample of observations is via the **range**.

**Range** = Maximum Value - Minimum Value

# Measures of Spread: Variance

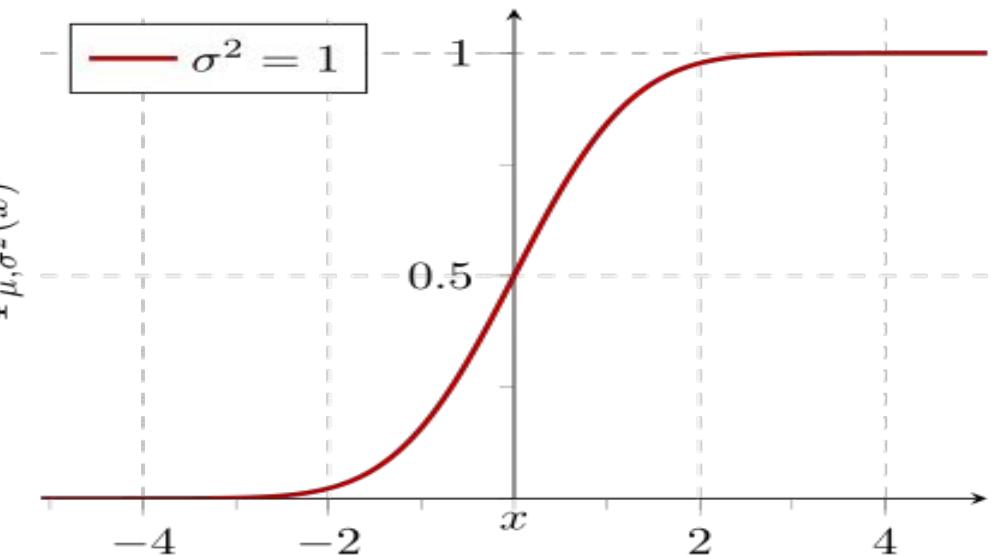

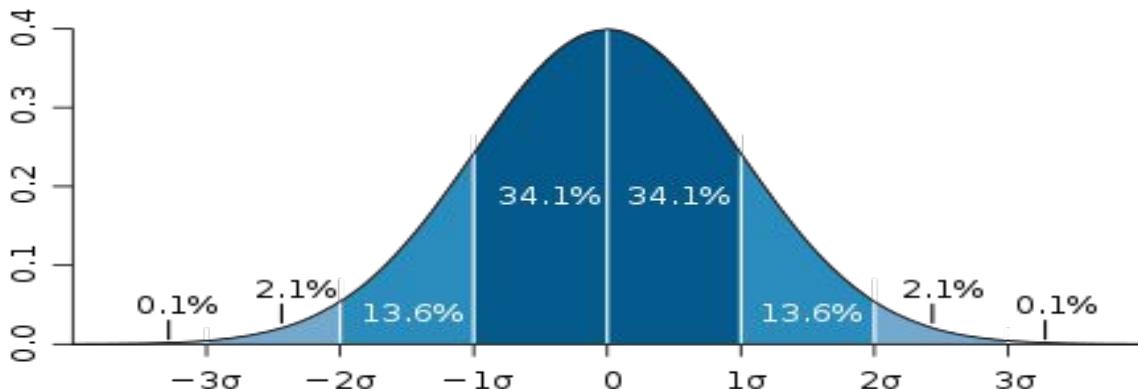

The (sample) **variance**, denoted  $\sigma^2$ , measures how much on average the sample values deviate from the mean:

$$\sigma^2 \equiv \mathbf{D}(X) = \mathbf{E}[(X - \mu)^2] = \sum_x (x - \mu)^2 p(x)$$

Note: the difference measures the amount by which each  $x$  deviates from the mean.

# Measures of Spread: Standard Deviation

The (sample) **standard deviation** is the square root of the variance

# Data Processing

---

## Workflow

---

### Data Vizualization (for EDA)

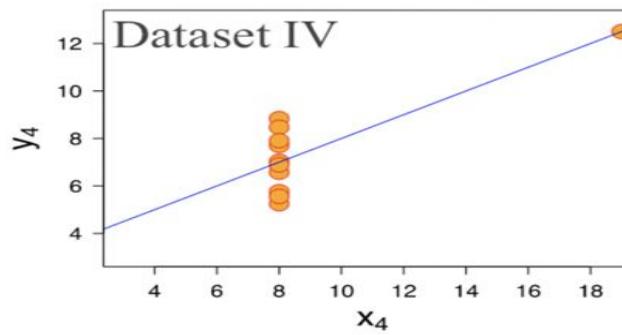

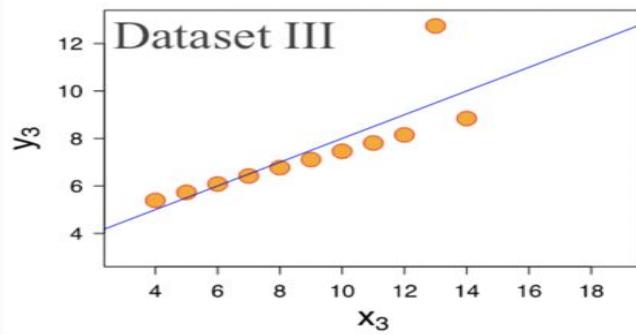

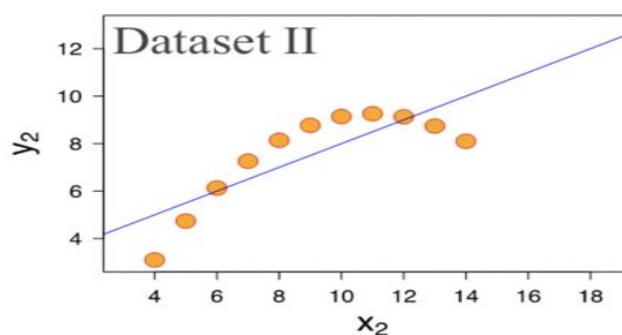

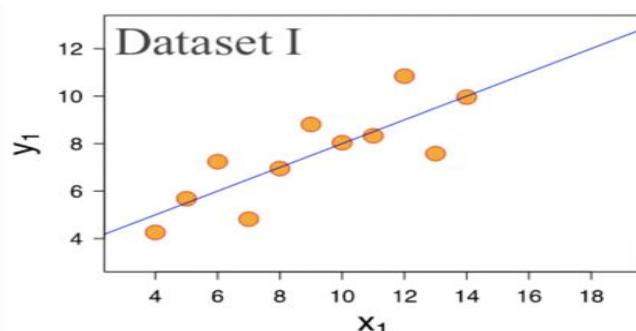

# Anscombe's Quartet

- Anscombe's quartet comprises four data sets that have nearly identical simple descriptive statistics, yet have very different distributions and appear very different when graphed.

Dataset I		Dataset II		Dataset III		Dataset IV		
x	y	x	y	x	y	x	y	
10	8.04	10	9.14	10	7.46	8	6.58	
8	6.95	8	8.14	8	6.77	8	5.76	
13	7.58	13	8.74	13	12.74	8	7.71	
9	8.81	9	8.77	9	7.11	8	8.84	
11	8.33	11	9.26	11	7.81	8	8.47	
14	9.96	14	8.1	14	8.84	8	7.04	
6	7.24	6	6.13	6	6.08	8	5.25	
4	4.26	4	3.1	4	5.39	19	12.5	
12	10.84	12	9.13	12	8.15	8	5.56	
7	4.82	7	7.26	7	6.42	8	7.91	
5	5.68	5	4.74	5	5.73	8	6.89	
Sum:	99.00	82.51	99.00	82.51	99.00	82.51	99.00	82.51
Avg:	9.00	7.50	9.00	7.50	9.00	7.50	9.00	7.50
Std:	3.32	2.03	3.32	2.03	3.32	2.03	3.32	2.03

# Anscombe's Quartet

- They were constructed in 1973 by the statistician Francis Anscombe to demonstrate both the importance of graphing data before analyzing it and the effect of outliers and other influential observations on statistical properties.

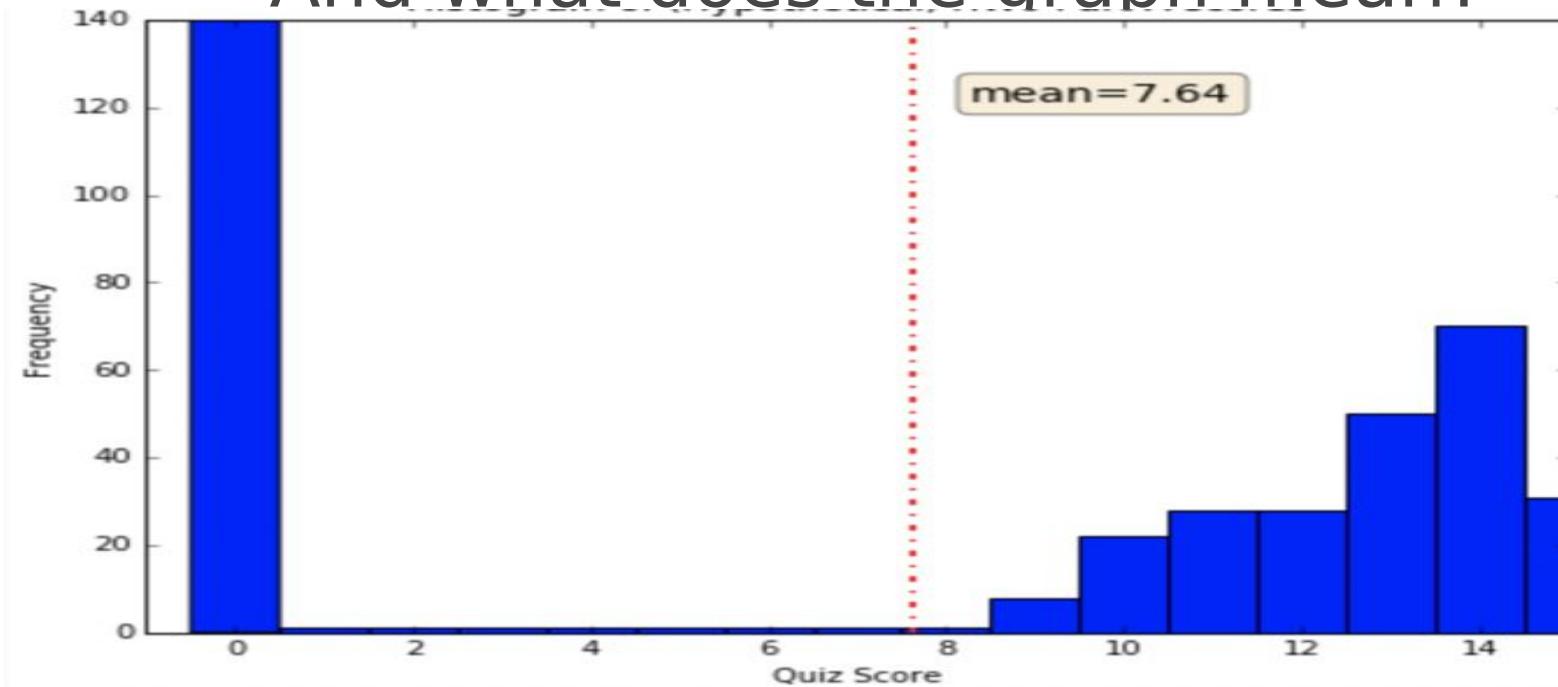

# More Visualization Motivation

The average score for school class: 7.64

What does that mean?

And what does the graph mean?

# More Visualization Motivation

Visualizations help us to analyze and explore the data:

- Identify hidden patterns and trends
  - Formulate/test hypotheses
  - Communicate any modeling results
- Present information and ideas succinctly
  - Provide evidence and support
  - Influence and persuade
- Determine the next step in analysis/modeling
  -

# Other Types of Visualizations

What do you want your visualization to show about your data?

**Distribution:** how a variable or variables in the dataset distribute over a range of possible values.

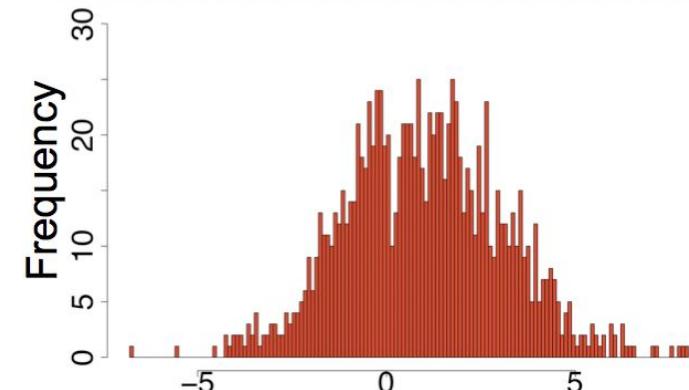

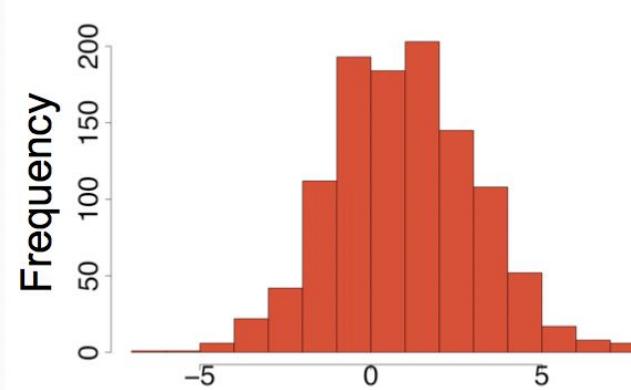

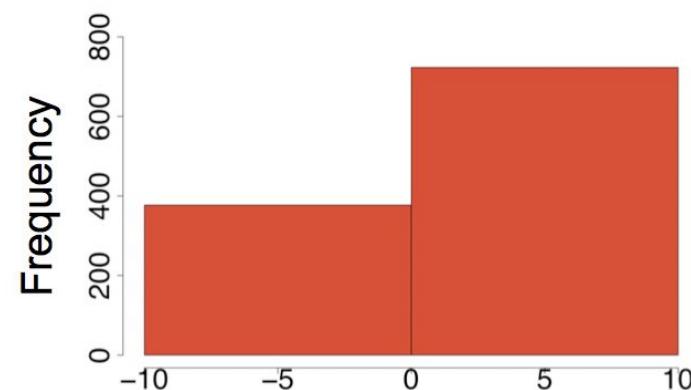

**Relationship:** how the values of multiple variables in the dataset relate

**Composition:** how the dataset breaks down into subgroups

**Comparison:** how trends in multiple variable or datasets compare

# Histogram

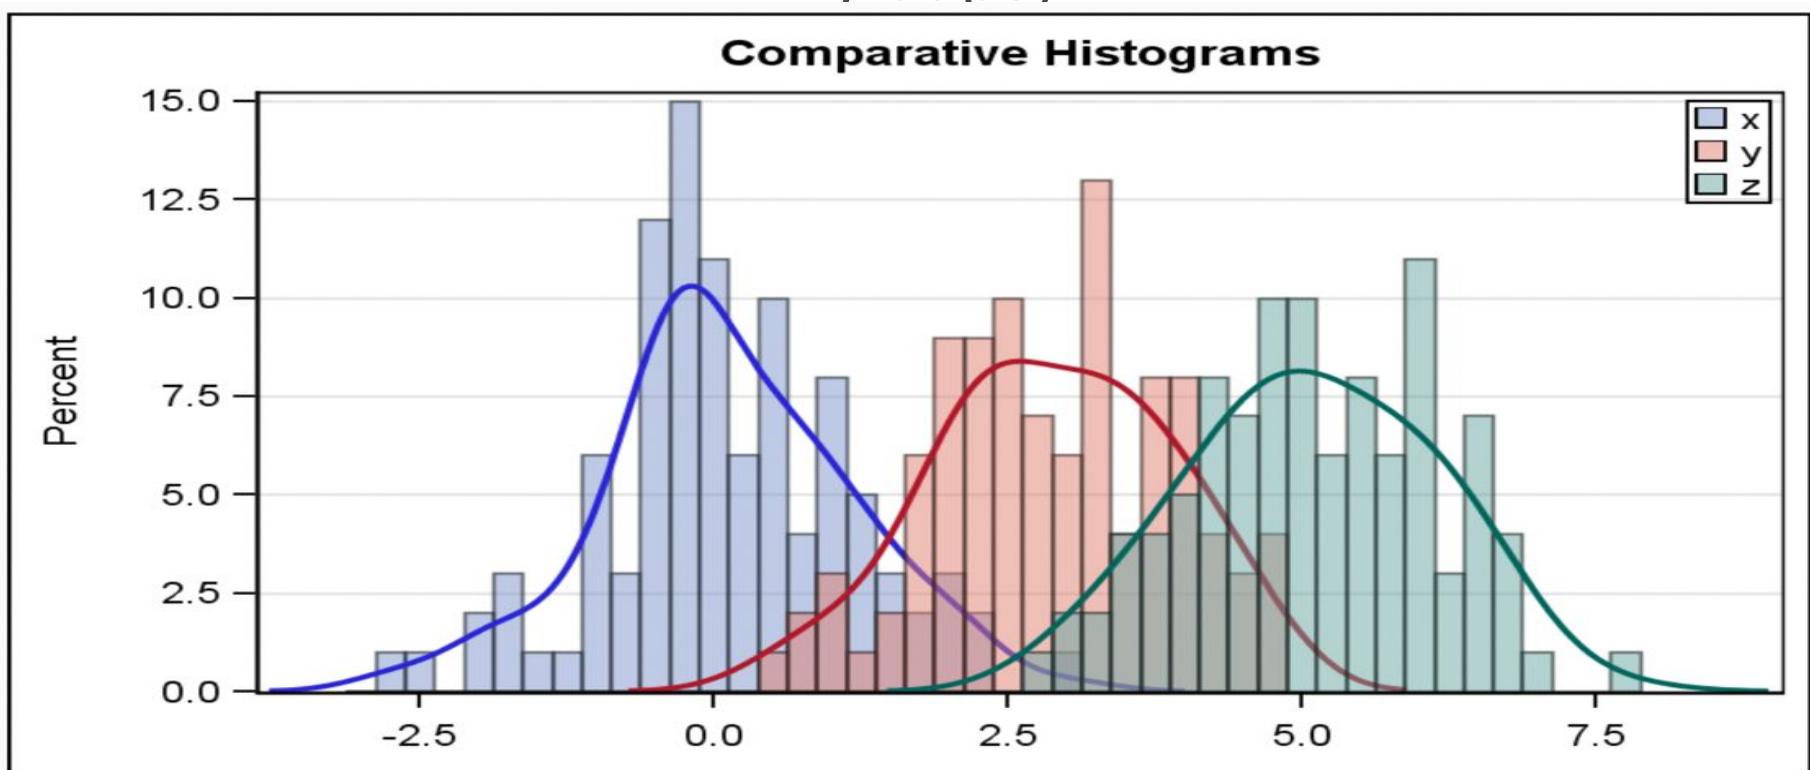

A **histogram** is a way to visualize how 1-dimensional data is distributed across certain values.

**Note:** Trends in histograms are sensitive to number of bins.

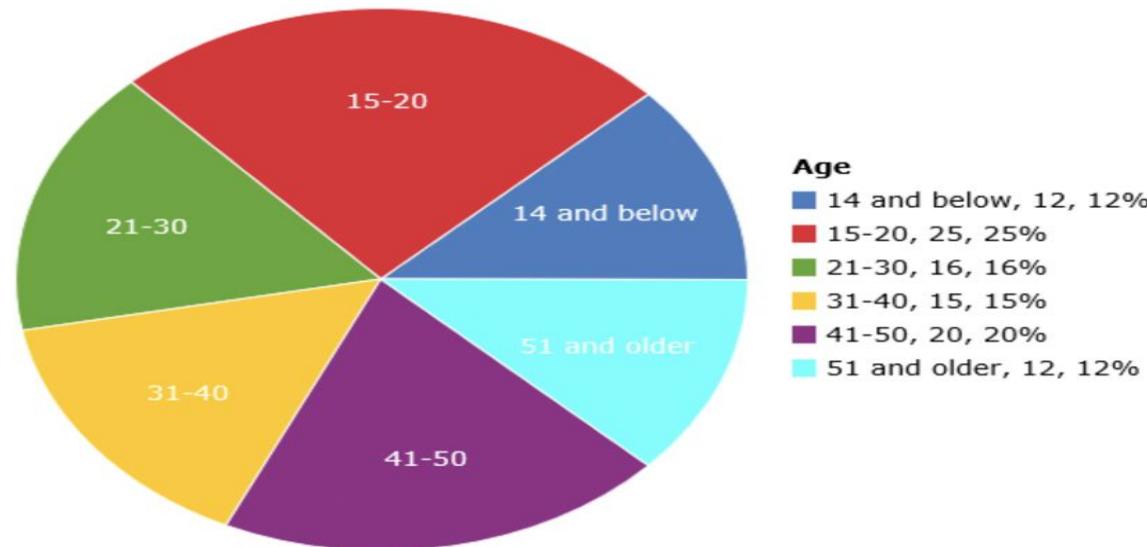

# Multiple Histogram

Plotting **multiple histograms** (and **kernel density estimates** of the distribution, here) on the same axes is a way to visualize how different variables compare (or how a variable differs over specific groups).

# Pie Chart

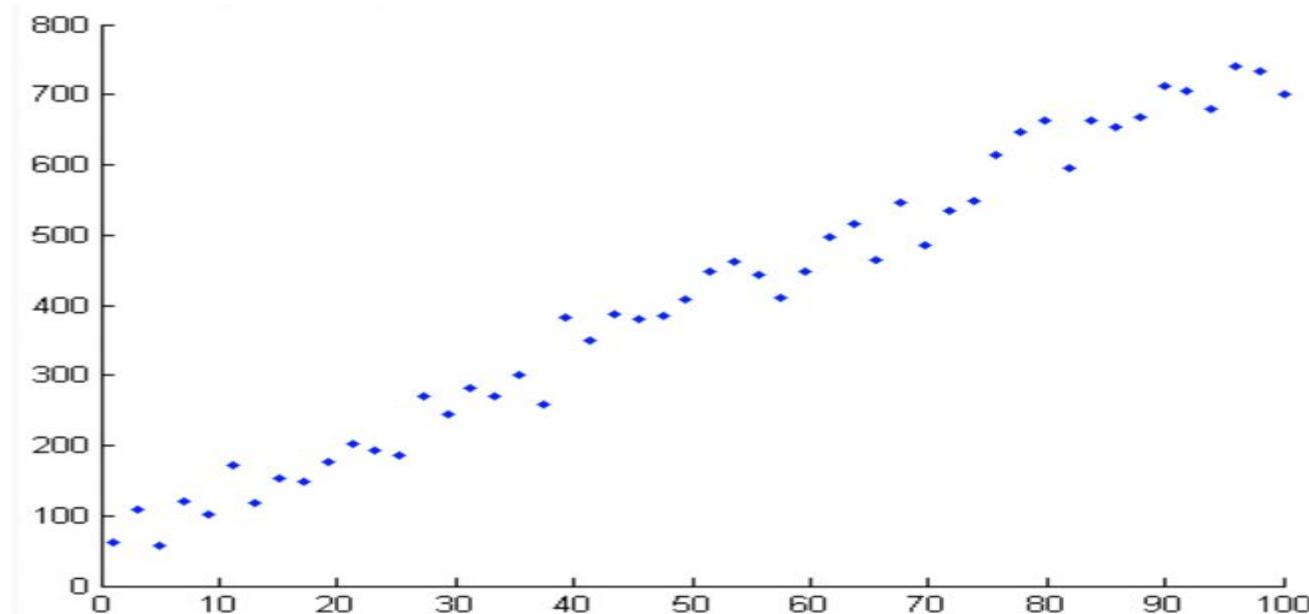

A **pie chart** is a way to visualize the static composition (aka, distribution) of a variable (or single group).

Pie charts are often frowned upon (and bar charts are used instead). Why?

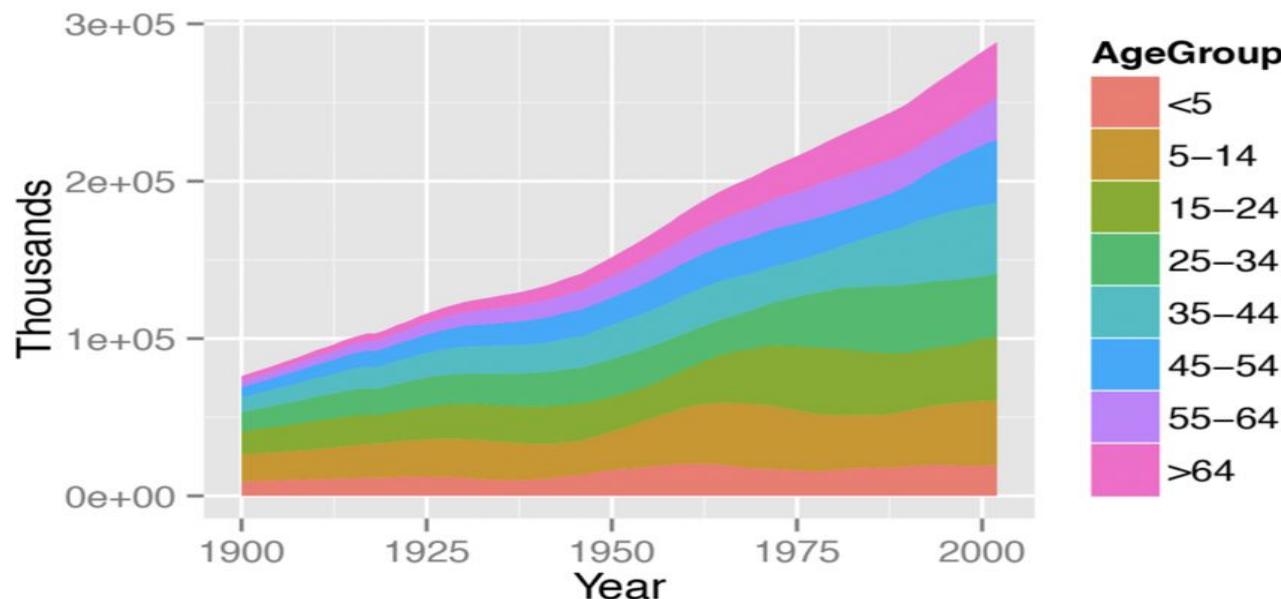

# Scatter Plot

A **scatter plot** is a way to visualize the relationship between two different attributes of multi-dimensional data.

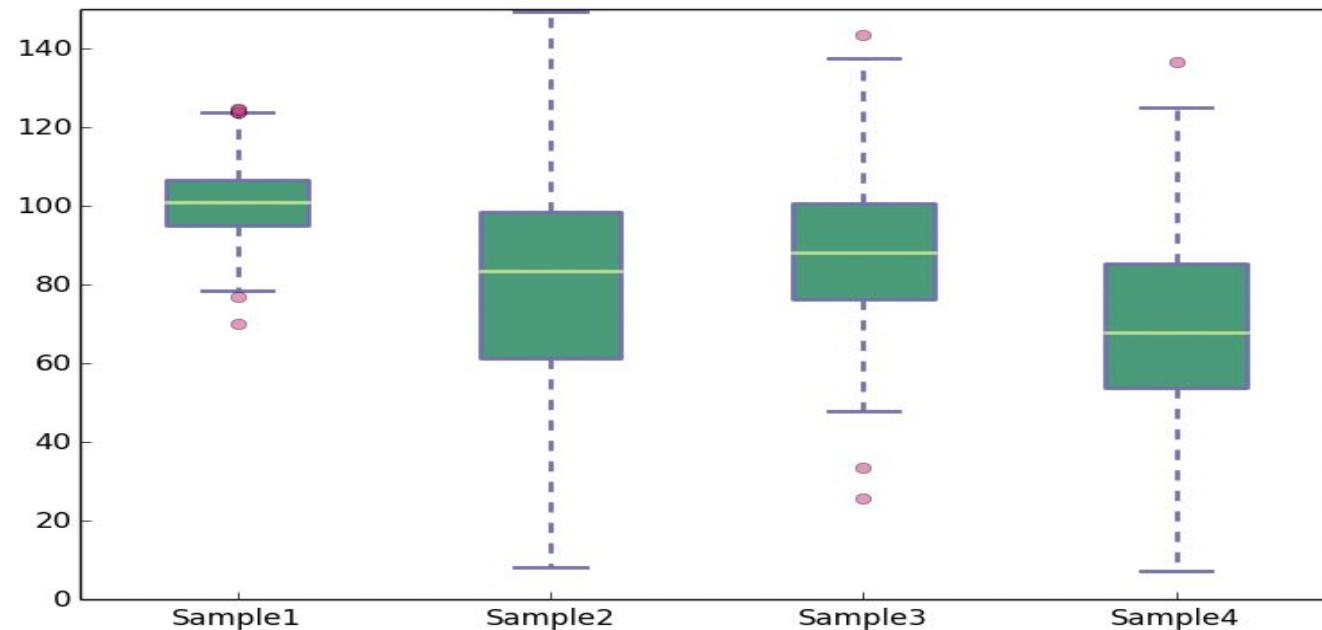

# Stacked Area Plot

A **stacked area graph** is a way to visualize the composition of a group as it changes over time (or some other quantitative variable). This shows the relationship of a categorical variable (AgeGroup) to a quantitative variable (year).

# Boxplot

A **boxplot** is a simplified visualization to compare a quantitative variable across groups. It highlights the range, quartiles, median and any outliers present in a data set.

# Some Complex Cases

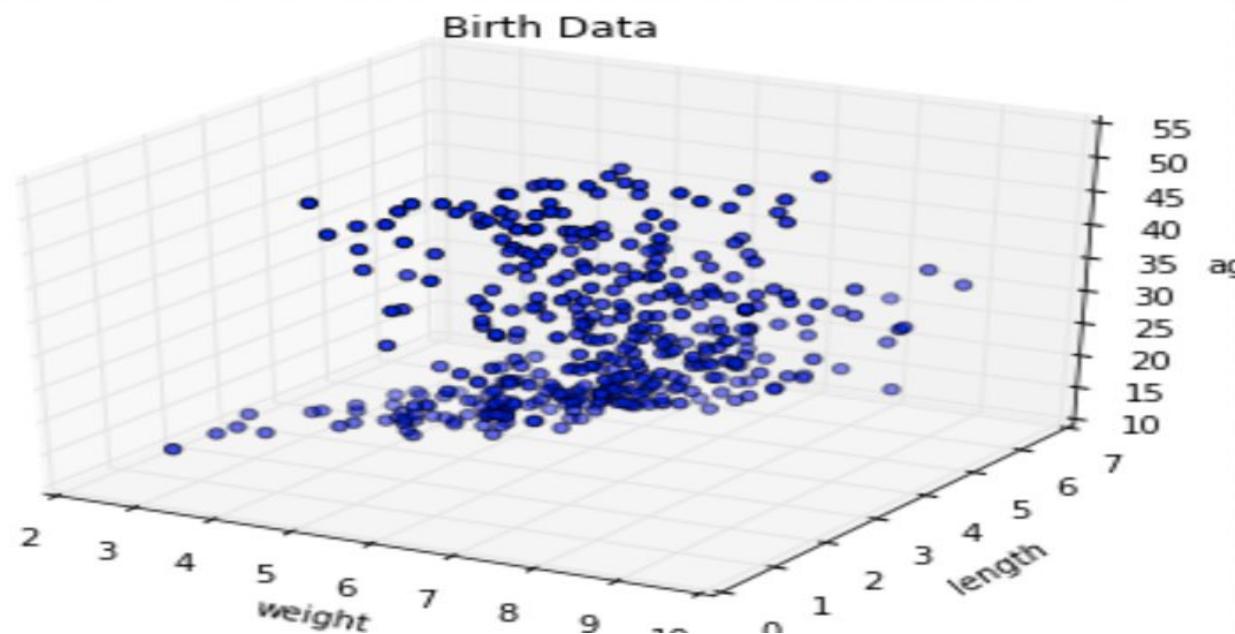

Often your dataset seem too complex to visualize:

Data is too **high dimensional** (how do you plot 100 variables on the same set of axes?)

Some variables are **categorical** (how do you plot values like Cat or No?)

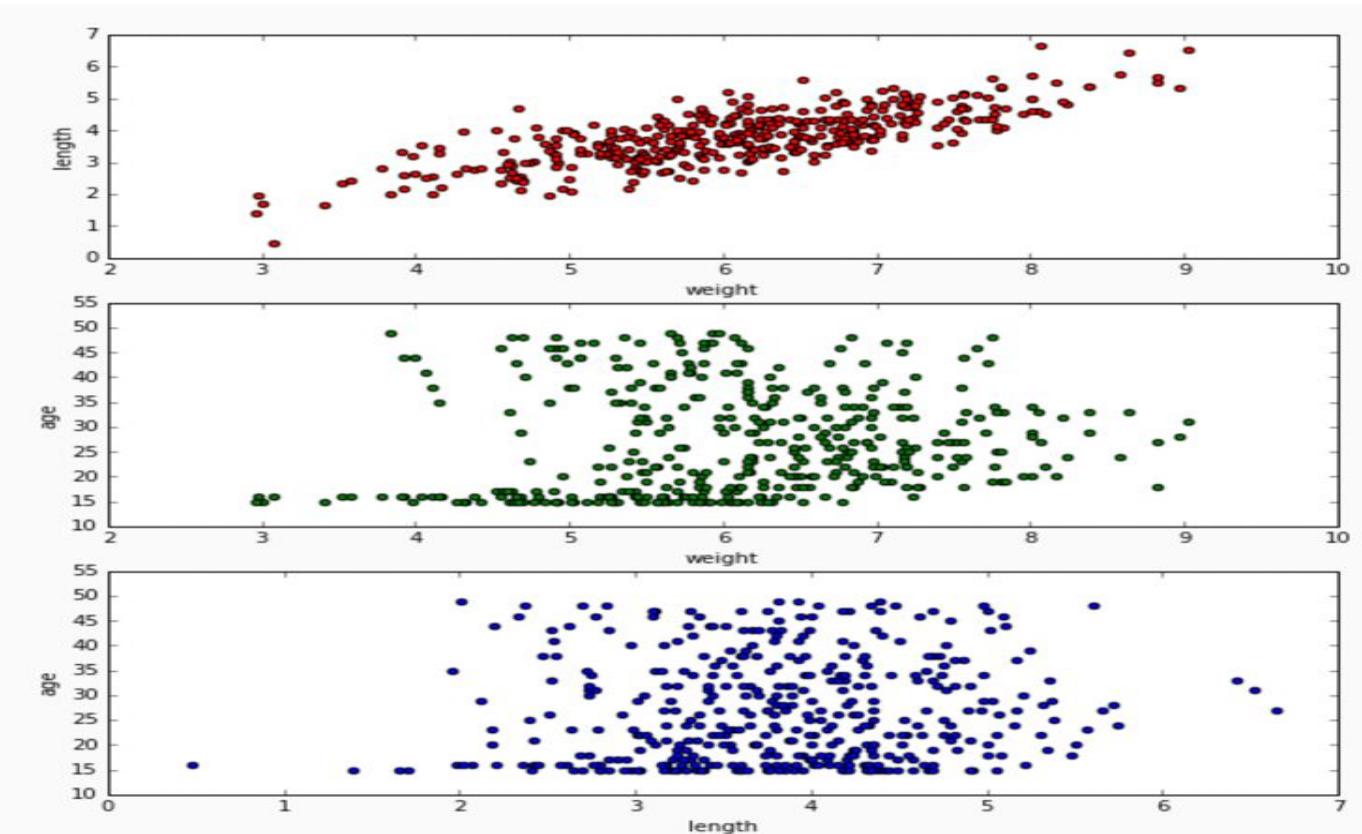

# Many Dimensions

When the data is high dimensional, a scatter plot of all data attributes can be impossible or unhelpful

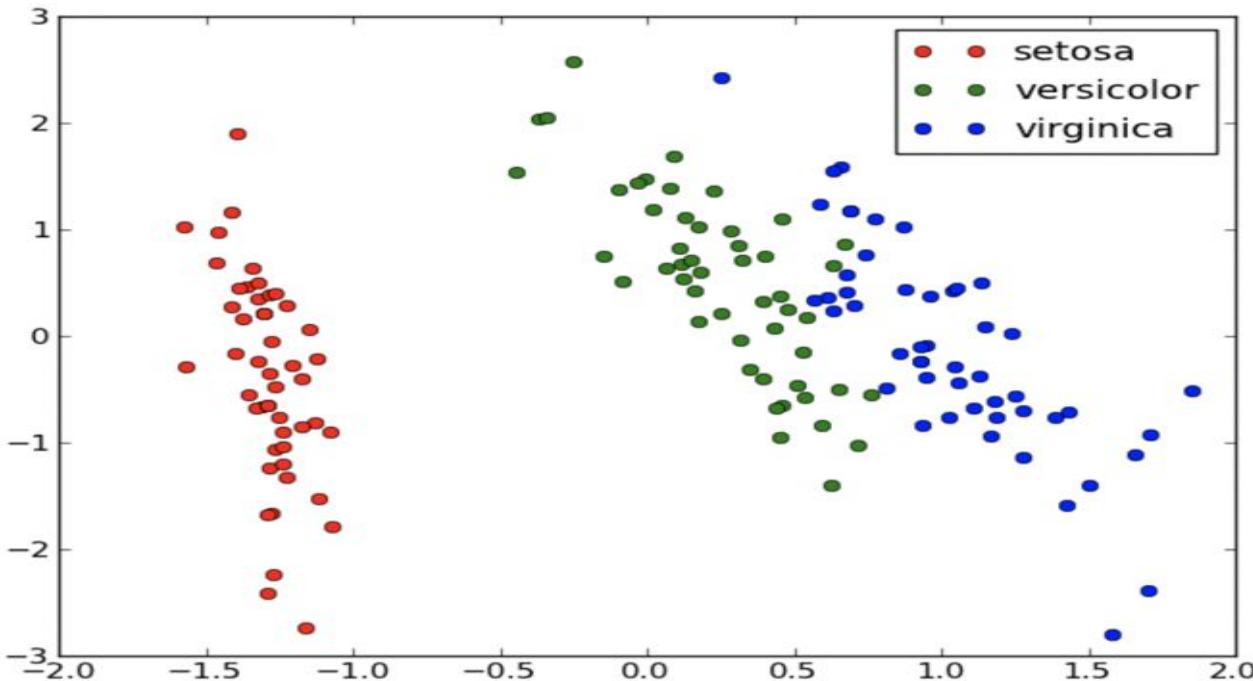

# Reducing complexity

Relationships may be easier to spot by producing **multiple plots of lower dimensionality**.

# Reducing complexity

For 3D data, color coding a categorical attribute can be “effective”

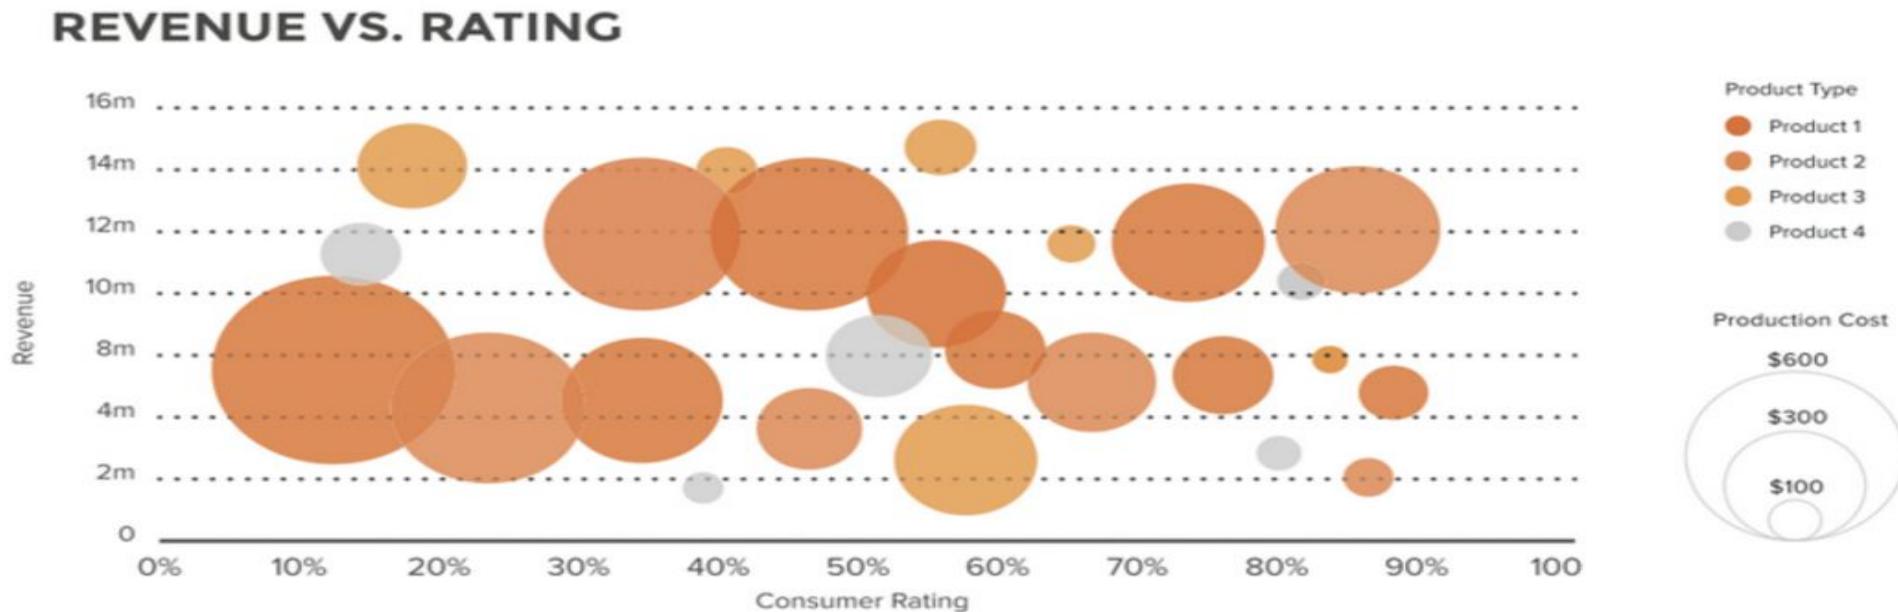

This visualizes a set of Iris measurements. The variables are: petal length, sepal length, Iris type (setosa, versicolor, virginica).

Except when it's not effective.

# Reducing complexity — 3D Bubble Plot

For 3D data, a quantitative attribute can be encoded by size in a bubble chart.

The above visualizes a set of consumer products. The variables are: revenue, consumer rating, product type and product cost.

# Data Processing

## EDA Example

# Recall -> Data Processing -> **EDA**

Ask an interesting question

Get the Data — **EDA!**

Explore the Data

Model the Data

Visualize the Results

# EDA for Hubway Data

**Introduction:** Hubway is metro-Boston's public bike share program, with more than 1600 bikes at 160+ stations across the Greater Boston area. Hubway is owned by four municipalities in the area.

By 2016, Hubway operated 185 stations and 1750 bicycles, with 5 million ride since launching in 2011.

**The Data:** In April 2017, Hubway held a Data Visualization Challenge at the Microsoft NERD Center in Cambridge, releasing 5 years of trip data.

**The Question:** What does the data tell us about the ride share

# Customer Question -> Data Science Question

Original customer question:

**'What does the data tell us about the ride share program?'**  
is not good for scientific investigation. Before we can improve the  
question, we should look at the data - **EDA!**

	seq_id	hubway_id	status	duration	start_date	strt_statn	end_date	end_statn	bike_nr	subsc_type	zip_code	birth_date	gender
0	1	8	Closed	9	7/28/2011 10:12:00	23.0	7/28/2011 10:12:00	23.0	B00468	Registered	'97217	1976.0	Male

4	5	12	Closed	12	7/28/2011 10:37:00	23.0	7/28/2011 10:37:00	23.0	B00554	Registered	'97214	1983.0	Female

Based on the data, what kind of **concrete questions** can we ask?

# The Data Exploration/Question Refinement Cycle - 1

**Who?** Who's using the bikes?

Refine into specific hypotheses:

- More men or more women?
- Older or younger people?
- Subscribers or one time users?

# The Data Exploration/Question Refinement Cycle - 2

**Where?** Where are bikes being checked out?

Refine into specific hypotheses:

- More in Boston than Cambridge?
- More in commercial or residential?
- More around tourist attractions?

**Sometimes the data is given to you in pieces and must be merged!**

# The Data Exploration/Question Refinement Cycle - 3

**When?** When are the bikes being checked out?

Refine into specific hypotheses:

- More during the weekend than on the weekdays?
- More during rush hour?
- More during the summer than the fall?

**Sometimes the feature you want to explore doesn't exist in the data, and must be engineered!**

# The Data Exploration/Question Refinement Cycle - 4

**Why?** For what reasons/activities are people checking out bikes?

Refine into specific hypotheses:

- More bikes are used for recreation than commute?
- More bikes are used for touristic purposes?
- Bikes are used to bypass traffic?

**Do we have the data to answer these questions with reasonable certainty?**

**What data do we need to collect in order to answer these**

# The Data Exploration/Question Refinement Cycle - 5

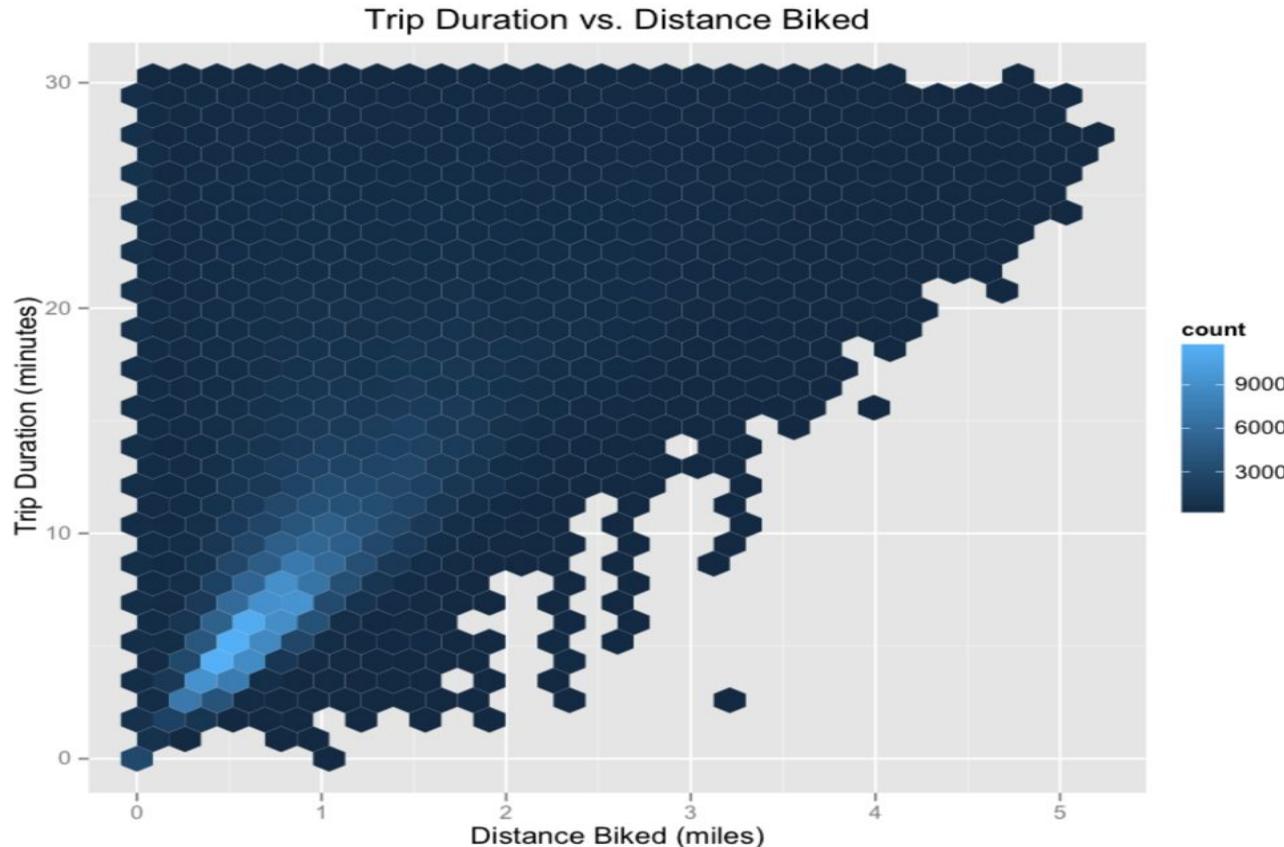

**How?** Questions that combine variables.

- How does user demographics impact the duration the bikes are being used? Or where they are being checked out?
- How does weather or traffic conditions impact bike usage?
- How do the characteristics of the station location affect the number of bikes being checked out?

**How questions are about modeling relationships between different variables.**

# Reducing complexity

So how well did we do in formulating creative hypotheses and manipulating the data for answers?

▼ When? When are the bikes being checked out?

Refine into specific hypotheses:

1. More during the weekend than on the weekdays?
2. More during rush hour?
3. More during the summer than the fall?

```
# Sometimes the feature you want to explore doesn't exist in the data, and must be  
  
# to find the time of the day we will use the start_date column and extract the hour  
# we use list comprehension
```

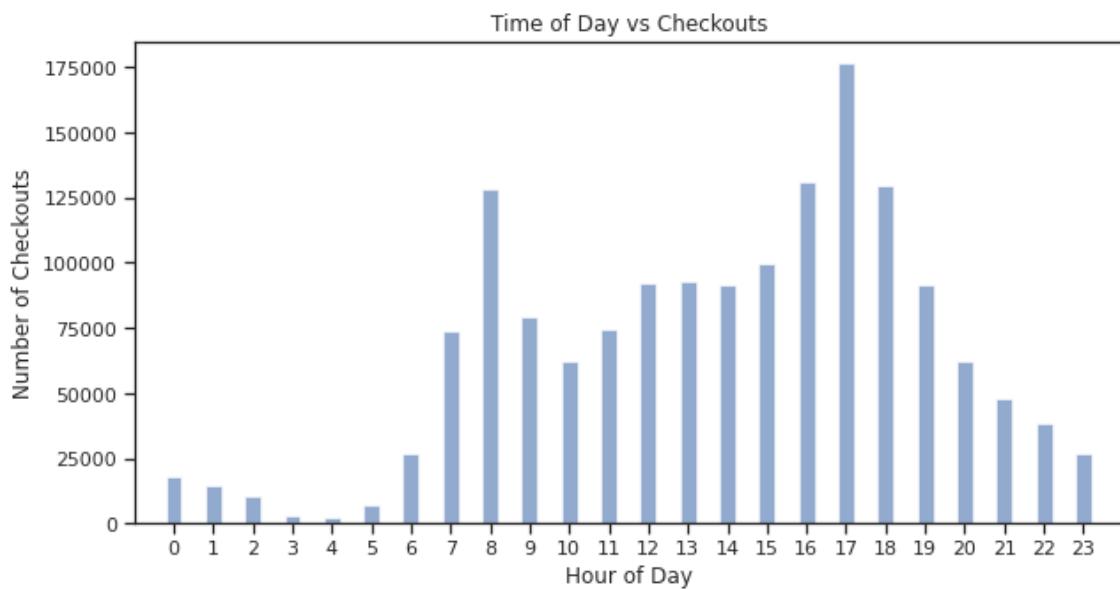

```

# we will be doing a lot of those
check_out_hours = highway_data['start date'].apply(lambda s: int(s[-8:-6]))
fig, ax = plt.subplots(1, 1, figsize=(10, 5))

check_out_counts = np.unique(check_out_hours, return_counts=True)
ax.bar(check_out_counts[0], check_out_counts[1], align='center', width=0.4, alpha=0.8)
ax.set_xlim([-1, 24])
ax.set_xticks(range(24))
ax.set_xlabel('Hour of Day')
ax.set_ylabel('Number of Checkouts')
ax.set_title('Time of Day vs Checkouts')

plt.show()

```

Why? For what reasons/activities are people checking out bikes?

Refine into specific hypotheses:

1. More bikes are used for recreation than commute?
2. More bikes are used for touristic purposes?
3. Bikes are used to bypass traffic?

Do we have the data to answer these questions with reasonable certainty? What data do we need to collect in order to answer these questions?

▼ How? Questions that combine variables.

1. How does user demographics impact the duration the bikes are being used? Or where they are being checked out?
2. How does weather or traffic conditions impact bike usage?
3. How do the characteristics of the station location affect the number of bikes being checked out?

How questions are about modeling relationships between different variables.

```
# Here we define the distance from a point as a python function.
# We set Boston city center long and lat to be the default value.
# you will become experts in building functions and using functions just like this

MA Ranzato

## Who is Y. LeCun?

# Who is Yann LeCun?

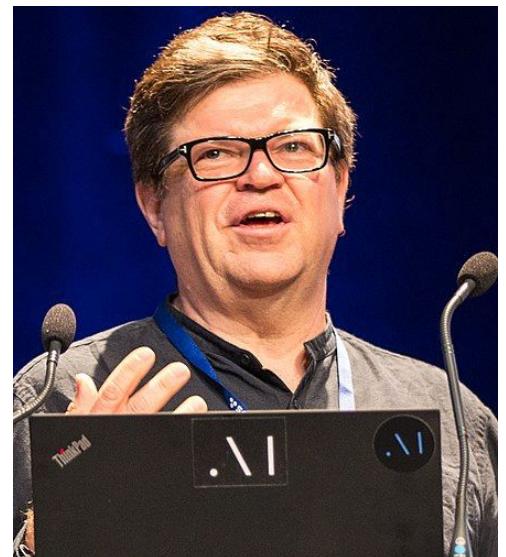

He is a founding father of convolutional neural nets (CNNs).

He is also one of the main creators of the DjVu image compression technology (together with Léon Bottou and Patrick Haffner).

Chief AI Scientist at Facebook.

LeCun received the 2018 Turing Award, together with Yoshua Bengio and Geoffrey Hinton, for their work on deep learning.

LeCun - together with Geoffrey Hinton and Yoshua Bengio - are referred to by some as the "Godfathers of AI" and "Godfathers of Deep Learning" ... **BUT** ... !!!

# 2016 IEEE CIS Neural Networks Pioneer Award goes to Jürgen Schmidhuber

Jürgen Schmidhuber is recipient of the 2016 IEEE CIS Neural Networks Pioneer Award, for "pioneering contributions to deep learning and neural networks."

<http://cis.ieee.org/award-recipients.html>

## Who is Schmidhuber?

Juergen Schmidhuber: Godel Machines, Meta-Learning, and LSTMs  
<https://www.youtube.com/watch?v=3Fl06evmweo>

# Who is Schmidhuber?

With his students Sepp Hochreiter, Felix Gers, Fred Cummins, Alex Graves, and others, Schmidhuber published increasingly sophisticated versions of a type of **recurrent neural network** called the **long short-term memory (LSTM)**.

**First results** were already reported in Hochreiter's **diploma thesis** (1991) which analyzed and overcame the famous vanishing gradient problem.

The name LSTM was introduced in a tech report (1995) leading to **the most cited LSTM publication** (1997) Deep Learning since ...

# 2016 IEEE CIS Neural Networks Pioneer Award goes to Jürgen Schmidhuber

The award ceremony took place on the 27th of July 2016 in Vancouver at the Award Banquet of [IJCNN 2016](#).

---

Transcript of the 3 min acceptance speech:

Dear IEEE,

it is a great honor to be listed among previous awardees such as K. Fukushima, who is present at this conference, the father of the deep convolutional neural architecture everybody is using now for computer vision.

The only thing that makes me a bit sad at this otherwise happy moment is that the Ukrainian mathematician A. G. Ivakhnenko, the father of deep learning himself, never got this award. His team had deep multilayer perceptrons with 8 layers or so back in the 1960s when I was a baby, at a time when others still focused on the limitations of shallow nets with a single layer. Apparently he was so far ahead of his time that even the not so young members of the award committees failed to appreciate the depth of his work.

## Who is A. G. Ivakhnenko?

...

the father of deep learning himself

and

перший виконуючий обов'язки декана ФІОТ

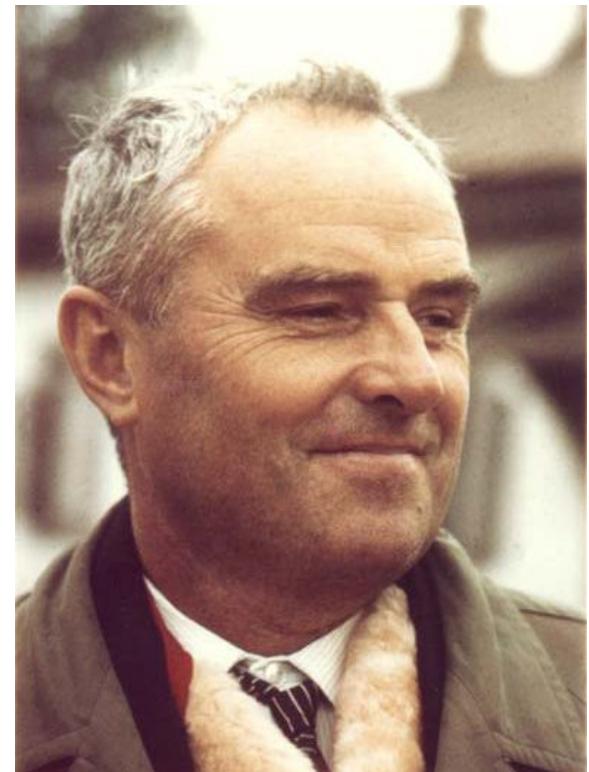

- перший “неофіційний” декан нашого факультету

# Who is A. G. Ivakhnenko?

Ukrainian mathematician most famous for developing the Group Method of Data Handling (GMDH), a method of inductive statistical learning, for which he is sometimes referred to as the "**Father of Deep Learning**".

## Main results in the context of DL:

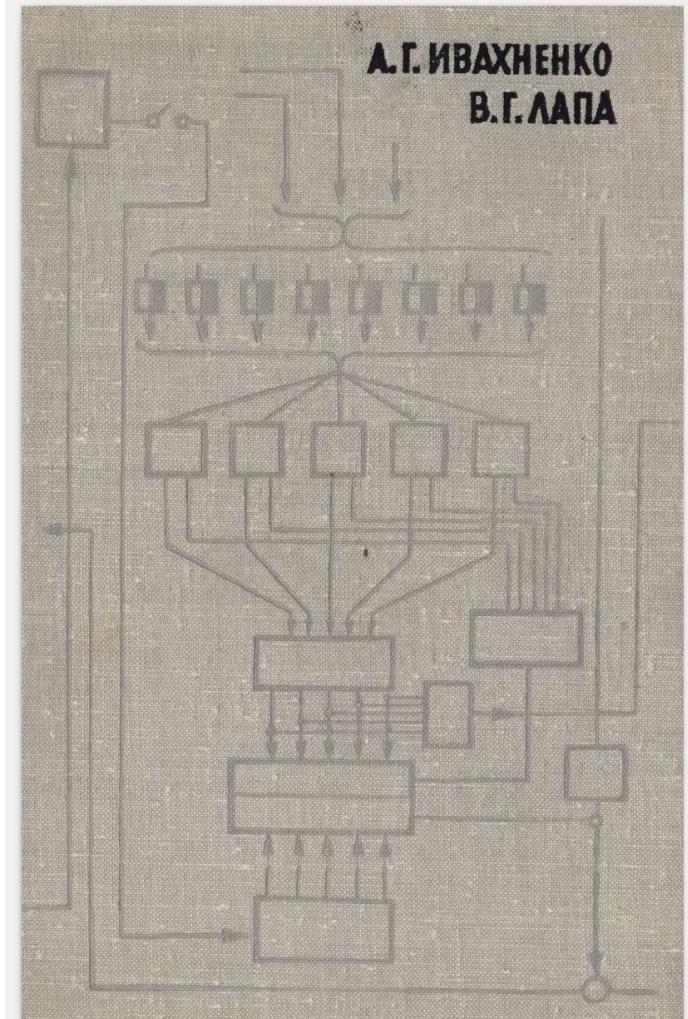

- Principle of construction of self-organizing deep learning networks,
- Design of multilayered neural networks with active neurons, where each neuron is an algorithm,
- Principle of self-learning pattern recognition. It was demonstrated at first in the cognitive system "Alpha", created under his leadership.

Alexey Ivakhnenko

Киев — 1965

Перша книжка А.Г.Івахненка про його систему "Альфа" - першу 8-шарову глибинну мережу.

# Система "Альфа" - перша 8-шарова глибинна мережа

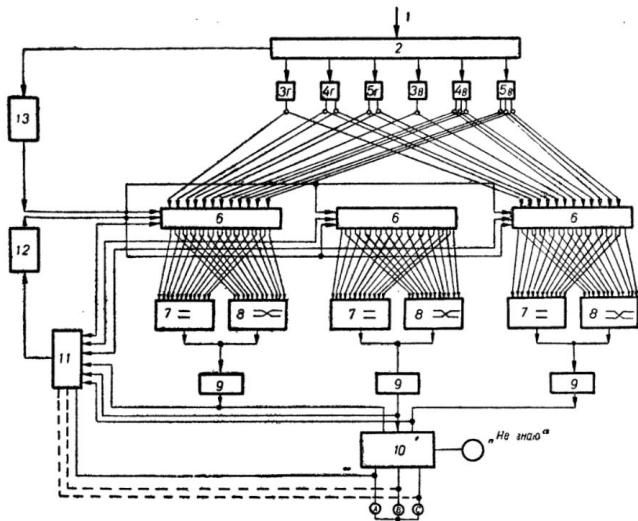

Рис. 49. Структурна схема розпізнавальної системи з позитивною зворотною зв'язкою.  
1 — вивчуваний образ; 2 — входове устроїство; 3—5 — датчики; 6 — групи асоціюючих зламів; 7 — прямі усилителі; 8 — реверсуючі усилителі; 9 — сумматори; 10 — індикатор більшості; 11 — управління порядком самобудучості; 12 — позитивна зв'язка самобудучості; 13 — разомкнута зв'язь обусловлення.

О.Г. Івахненко (справа) та Норберт Вінер (зліва) під час конференції ІФАК у Києві (1960р.)

Насправді вона була розроблена ще раніше, не у 1965-1971, як пише Шмідхубер, а у 1962 році.

21. Івахненко О.Г., Системи, що саморганізуються, з додатними зворотними зв'язками. "Автоматика", №3, 1962.

# Deep learning = Learning representations/features

- The traditional model of pattern recognition (since the late 50's)
  - Fixed/engineered features (or fixed kernel) + trainable classifier

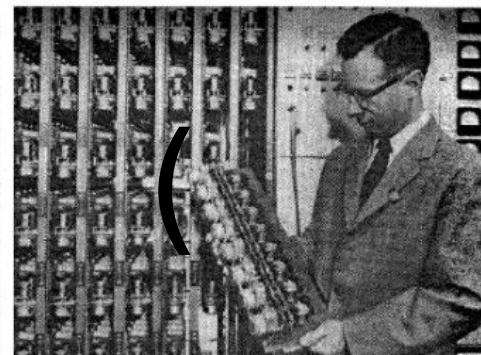

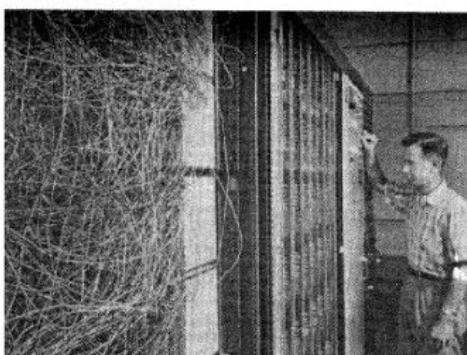

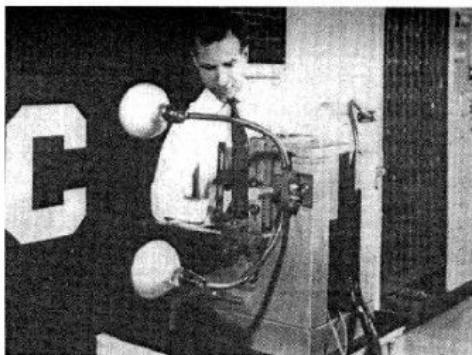

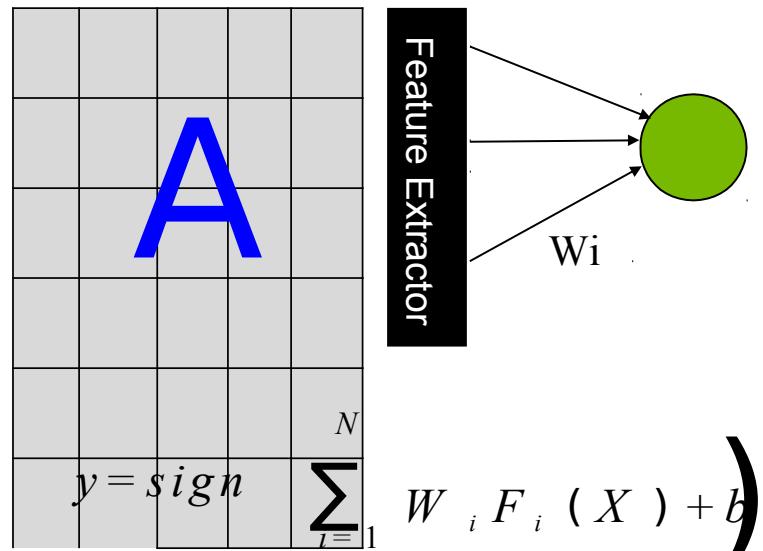

- End-to-end learning / Feature learning / Deep learning

# This basic model has not evolved much since the 50's

- The first learning machine: the **Perceptron**
  - Built at Cornell in 1960
- The Perceptron was a **linear classifier** on top of a simple **feature extractor**
- The vast majority of practical applications of ML today use glorified **linear classifiers** or glorified template matching.
- Designing a feature extractor requires considerable efforts by experts.

# Linear machines and their limitations

# Linear machines: regression with mean square

## Linear regression, mean square loss:

- Decision rule:
- Loss function:
- Gradient of loss:
- Update rule:
- Direct solution: solve linear system

# Linear machines

## Perception

- Decision rule:  $(F \text{ is the threshold function})$
- Loss function:
- Gradient of loss:
- Update rule:
- Direct solution: fine  $W$  such that

# Linear machines: logistic regression

## Logistic regression, negative log-likelihood loss function:

- Decision rule:
- Loss function:
- Gradient of loss:
- Update rule:

# General gradient-based supervised learning machine

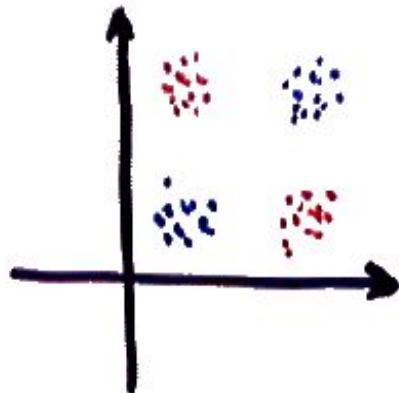

Neural nets, and many other models:

- Decision rule:  $y = F(W, X)$ , where  $F$  is some function, and  $W$  some parameter vector.
- Loss function: “discrepancy” between  $A$  and  $B$ .  
where  $D(y, f)$  measures the
- Gradient loss:
- Update rule:

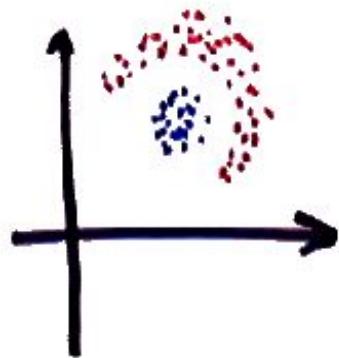

Three questions:

- What architecture  $F(W, X)$ .
- What loss function  $L(W, y^i, X^i)$ .
- What optimization method.

## Limitations of Linear Machines

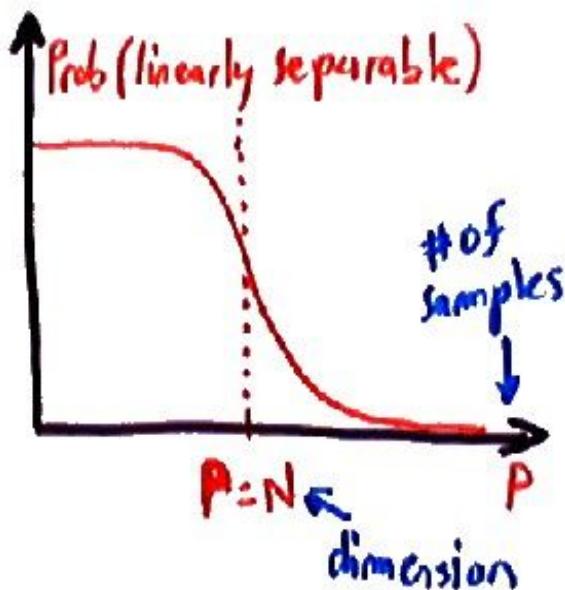

The *Linearly separable* dichotomies are the partitions that are realizable by a linear classifier (the boundary between the classes is a hyperplane).

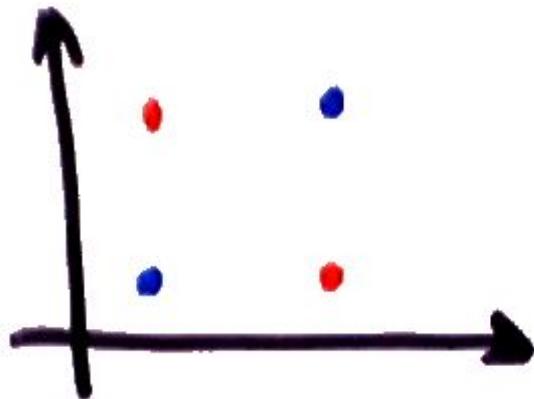

# Number of Linearly Separable Dichotomies

The probability that  $P$  samples of dimension  $N$  are linearly separable goes to zero very quickly as  $P$  grows larger than  $N$  (Cover's theorem, 1966).

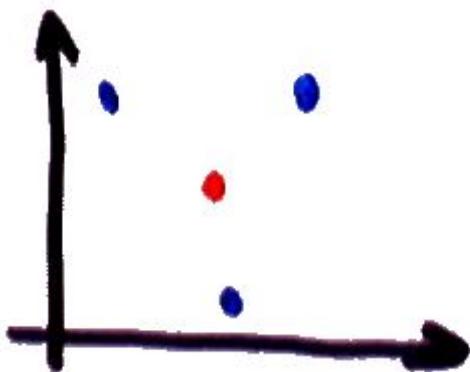

- Problem: there are  $2^P$  possible dichotomies of  $P$  points.
- Only about  $N$  are linearly separable.
- If  $P$  is larger than  $N$ , the probability that a random dichotomy is linearly separable is very, very small.

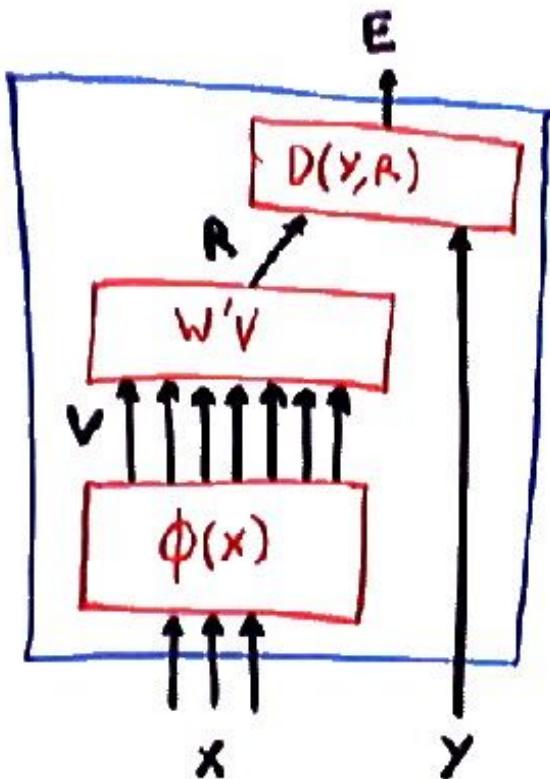

## Example of Non-Linearly Separable Dichotomies

- Some seemingly simple dichotomies are not linearly separable
- **Question:** How do we make a given problem linearly separable?

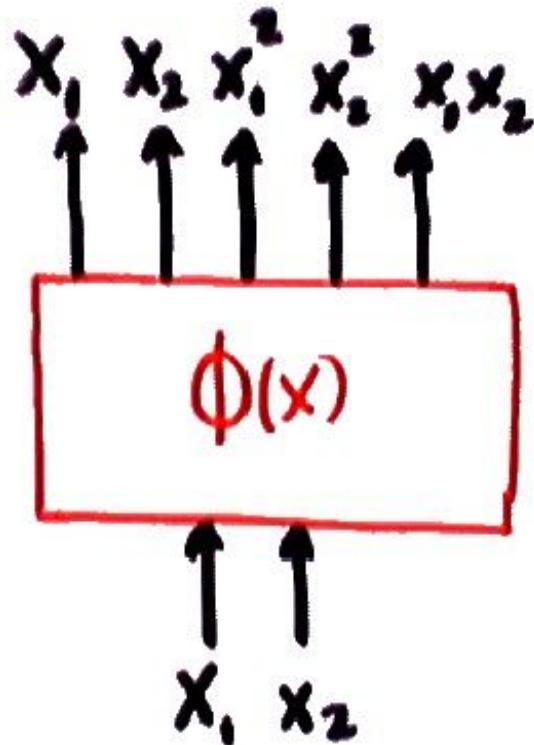

# Making $N$ Larger: Preprocessing

- **Answer 1:** we make  $N$  larger by augmenting the input variables with new “features”.
- we map/project  $X$  from its original  $N$ -dimensional space into a higher dimensional space where things are more likely to be linearly separable, using a vector function  $\Phi(X)$ .
- $E(Y, X, W) = D(Y, R)$
- $R = f(W'V)$
- $V = \Phi(X)$

## Adding Cross-Product Terms

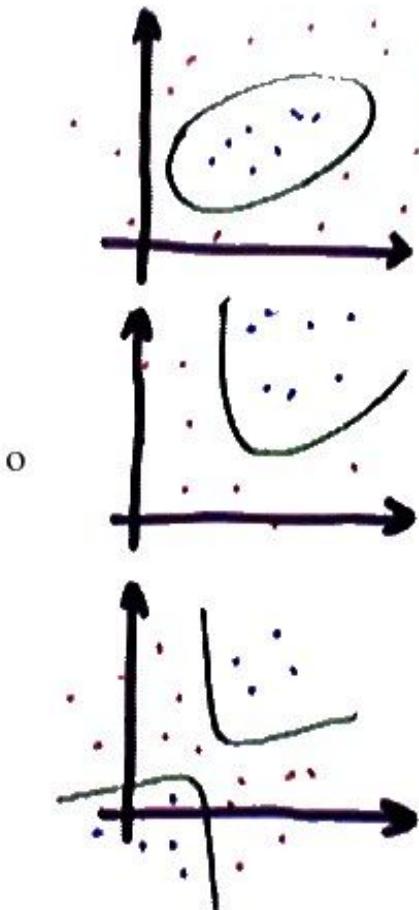

- Polynomial Expansion.
- If our original input variables are  $(1, x_1, x_2)$ , we construct a new *feature vector* with the following components:

$$\Phi(1, x_1, x_2) = (1, x_1, x_2, x_1^2, x_2^2, x_1x_2)$$

i.e. we add all the cross-products of the original variables.

- we map/project  $X$  from its original  $N$ -dimensional space into a higher dimensional space with  $N(N + 1)/2$  dimensions.

# Polynomial Mapping

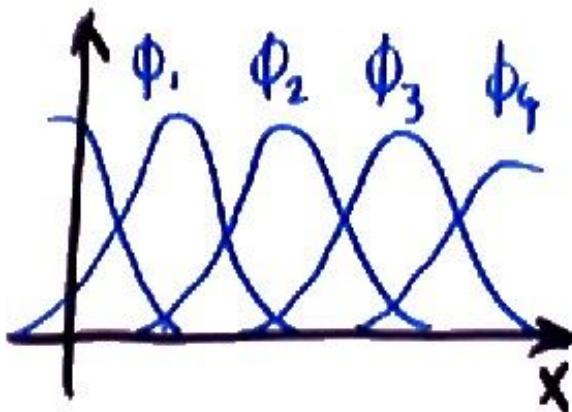

- Many new functions are now separable with the new architecture.
- With cross-product features, the family of class boundaries in the original space is the conic sections (ellipse, parabola, hyperbola).
- to each possible boundary in the original space corresponds a linear boundary in the transformed space.
- Because this is essentially a linear classifier with a preprocessing, we can use standard linear learning algorithms (perceptron, linear regression, logistic regression...).

# Problems with polynomial mapping

- We can generalize this idea to higher degree polynomials, adding cross-product terms with 3, 4 or more variables
- Unfortunately, the number of terms is the number of combinations  $d$  choose  $N$ , which grows like  $N^d$ , where  $d$  is the degree, and  $N$  the number of original variables
- In particular, the number of free parameters that must be learned is also of order  $N^d$ .
- This is impractical for large  $N$  and for  $d > 2$
- Example: handwritten digit recognition (16x16 pixel images). Number of variables: 256. degree 2: 32,896 variables. Degree 3: 2,796,160. degree 4: 247,460,160...

## Next Idea: Tile the Space

place a number of equally-spaced “bumps” that cover the entire input space.

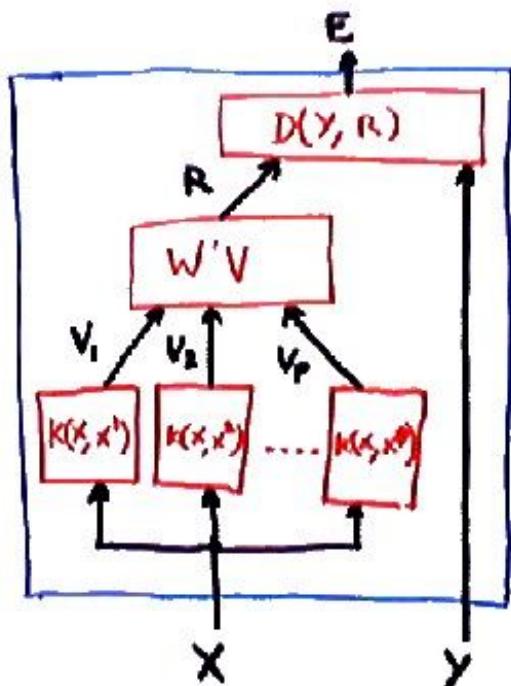

- For classification, the bumps can be Gaussians
- For regression, the basis functions can be wavelets, sine/cosine, splines (pieces of polynomials)....
- **problem:** this does not work with more than a few dimensions.
- The number of bumps necessary to cover an  $N$  dimensional space grows exponentially with  $N$ .

# Sample-Centered Basis Functions (Kernels)

Place the center of a basis function around each training sample. That way, we only spend resources on regions of the space where we actually have training samples.

- Discriminant function:

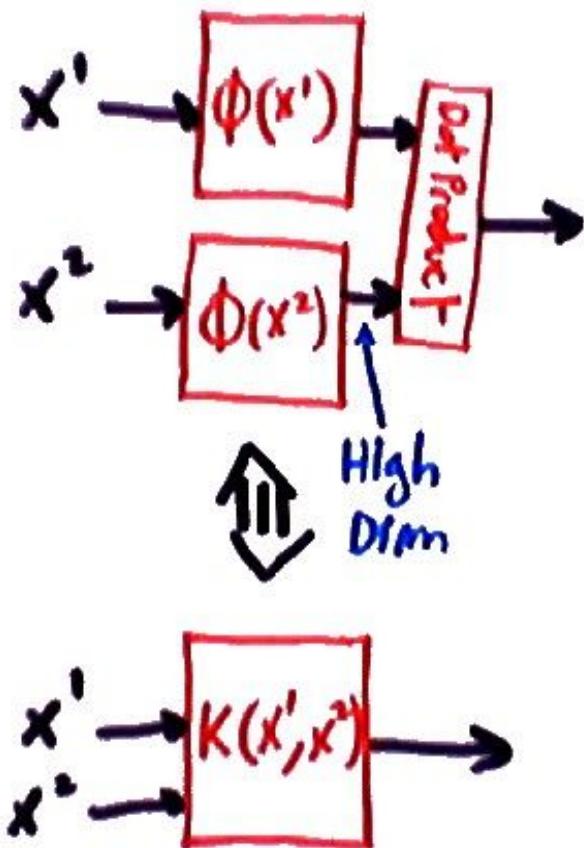

$$f(X, W) = \sum_{k=1}^{k=P} W_k K(X, X^k)$$

- $K(X, X')$  often takes the form of a *radial basis function*:

$$K(X, X') = \exp(b||X - X'||^2) \text{ or a polynomial } K(X, X') = (X \cdot X' + 1)^m$$

- This is a very common architecture, which can be used with a number of energy functions.
- In particular, this is the architecture of the so-called **Support Vector Machine** (SVM), but the energy function of the SVM is a bit special. We will study it later in the course.

# The Kernel Trick

- If the kernel function  $K(X, X')$  verifies the *Mercer conditions*, then there exist a mapping  $\Phi$ , such that  $\Phi(X).\Phi(X') = K(X, X')$ .
- The Mercer conditions are that  $K$  must be symmetric, and must be positive definite (i.e  $K(X, X)$  must be positive for all  $X$ ).
- In other words, if we want to map our  $X$  into a high-dimensional space (so as to make them linearly separable), and all we have to do in that space is compute dot products, we can take a shortcut and simply compute  $K(X^1, X^2)$  without going through the high-dimensional space.
- This is called the “**kernel trick**”. It is used in many so-called Kernel-based methods, including Support Vector Machines.

## Examples of Kernels

---

- **Quadratic kernel:**  $\Phi(X) = (1, \sqrt{2}x_1, \sqrt{2}x_2, \sqrt{2}x_1x_2, x_1^2, x_2^2)$  then

$$K(X, X') = \Phi(X) \cdot \Phi(X') = (X \cdot X' + 1)^2$$

- **Polynomial kernel:** this generalizes to any degree  $d$ . The kernel that corresponds to  $\Phi(X)$  being a polynomial of degree  $d$  is

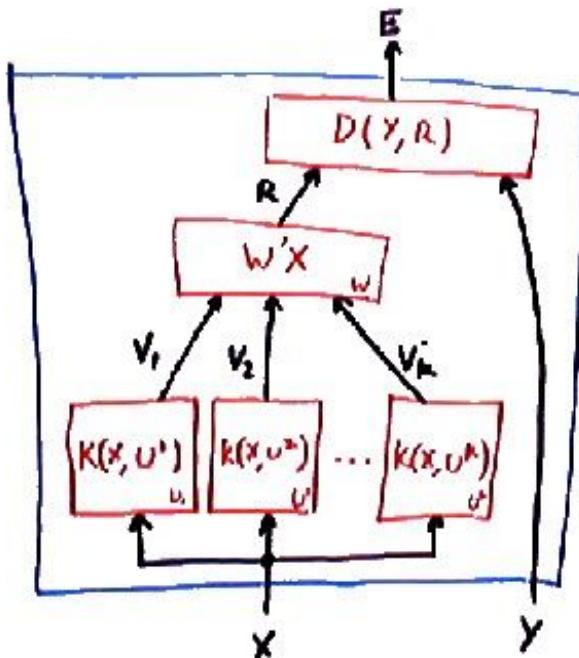

$$K(X, X') = \Phi(X) \cdot \Phi(X') = (X \cdot X' + 1)^d.$$

- **Gaussian Kernel:**

$$K(X, X') = \exp(-b||X - X'||^2)$$

This kernel, sometimes called the Gaussian Radial Basis Function, is very commonly used.

# Sparse Basis Functions

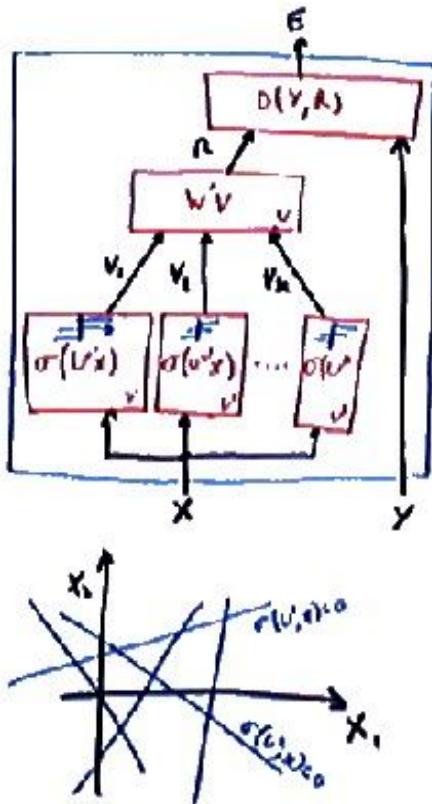

- Place the center of a basis function around areas containing training samples.
- Idea 1: use an unsupervised clustering algorithm (such as K-means or mixture of Gaussians) to place the centers of the basis functions in areas of high sample density.
- Idea 2: adjust the basis function centers through gradient descent in the loss function.

The discriminant function  $F$  is:

$$F(X, W, U^1, \dots, U^K) = \sum_{k=1}^{K=k} W_k K(X, U^k)$$

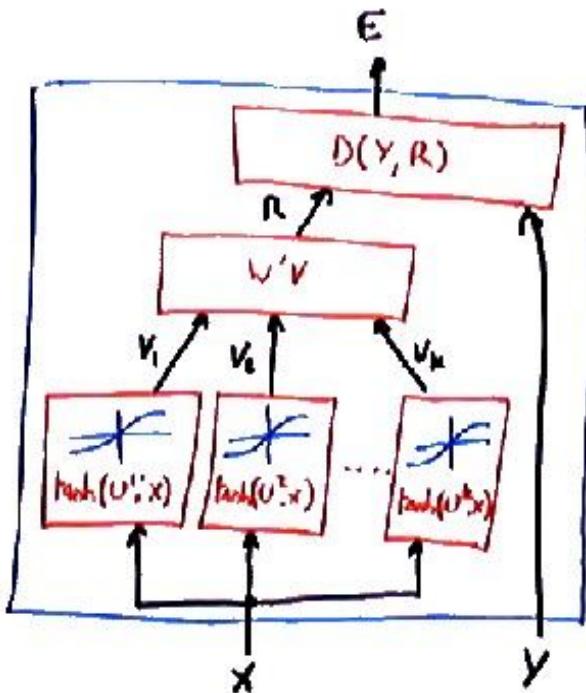

## Other Idea: Random Directions

- Partition the space in lots of little domains by randomly placing lots of hyperplanes.
- Use many variables of the type  $q(W^k X)$ , where  $q$  is the threshold function (or some other squashing function) and  $W_k$  is a randomly picked vector.
- This is the original Perceptron.
- Without the non-linearity, the whole system would be linear (product of linear operations), and therefore would be no more powerful than a linear classifier.
- **problem:** a bit of a wishful thinking, but it works occasionally.

# Neural Net with a Single Hidden Layer

A particularly interesting type of basis function is the sigmoid unit:  $V_k = \tanh(U'^k X)$

- a network using these basis functions, whose output is  $R = \sum_{k=1}^{K} W_k V_k$  is called a *single hidden-layer neural network*.
- Similarly to the RBF network, we can compute the gradient of the loss function with respect to the  $U^k$ :

$$\frac{\partial L(W)}{\partial U^j} = \frac{\partial L(W)}{\partial R} W_j \frac{\partial \tanh(U_j'X)}{\partial U_j}$$

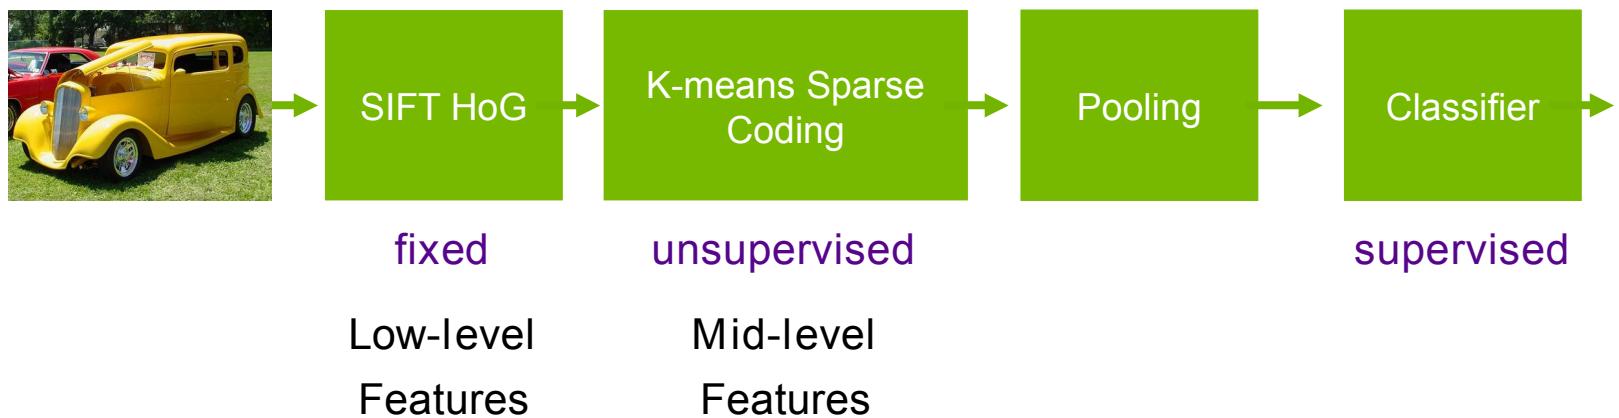

$$= \frac{\partial L(W)}{\partial R} W_j \tanh'(U_j'X) X'$$

Any well-behaved function can be approximated as close as we wish by such networks (but  $K$  might be very large).

# Architecture of “mainstream” pattern recognition systems

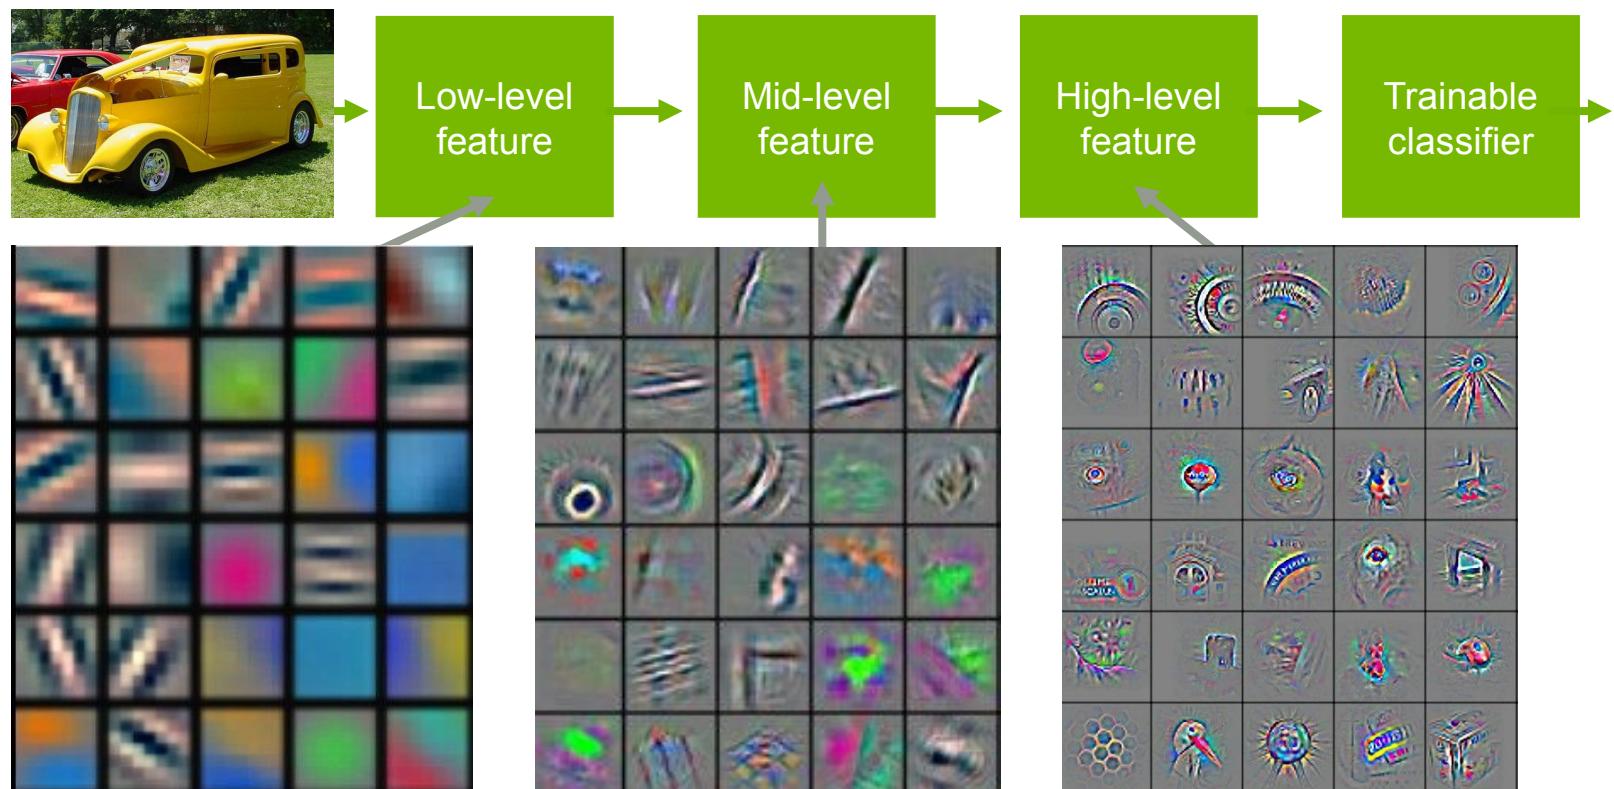

- Modern architecture for pattern recognition

- Speech recognition: early 90's – 2011

# Deep learning = learning hierarchical representations

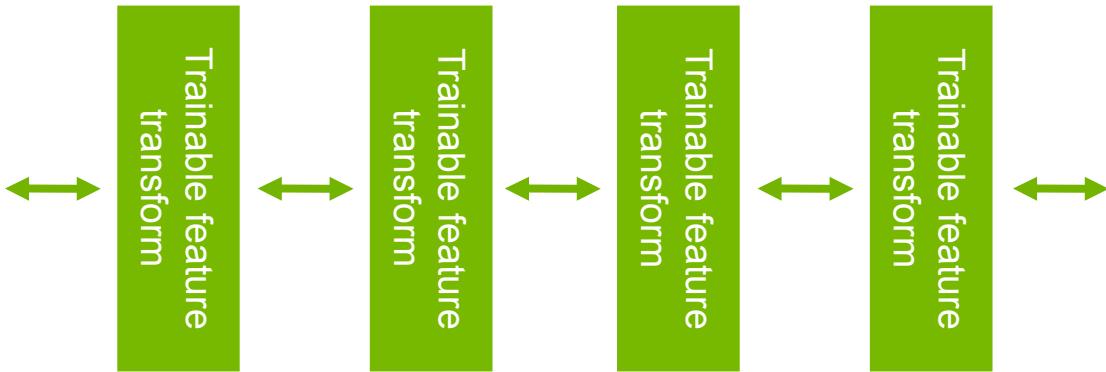

It's **deep** if it has **more than one stage** of non-linear feature transformation

Feature visualization of convolutional net trained on ImageNet from [Zeiler & Fergus 2013]

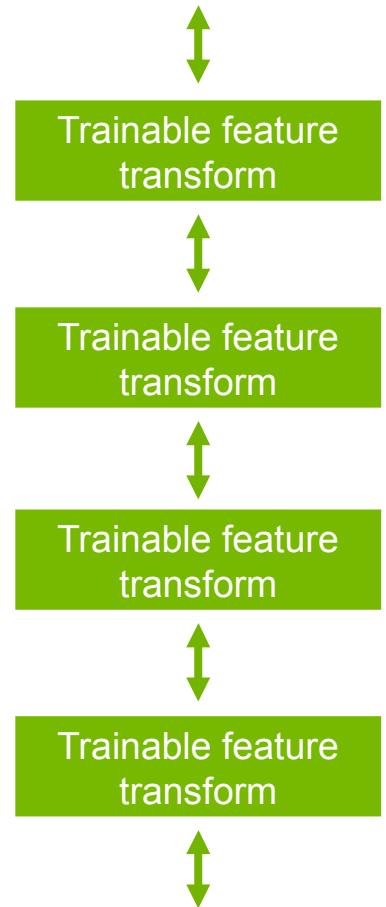

# Trainable feature hierarchy

- Hierarchy of representations with increasing level of abstraction Each stage is a kind of trainable feature transform
- Image recognition
  - Pixel → edge → texton → motif → part → object
- Text
  - Character → word → word group → clause → sentence → story
- Speech
  - Sample → spectral band → sound → ... → phone → phoneme → word

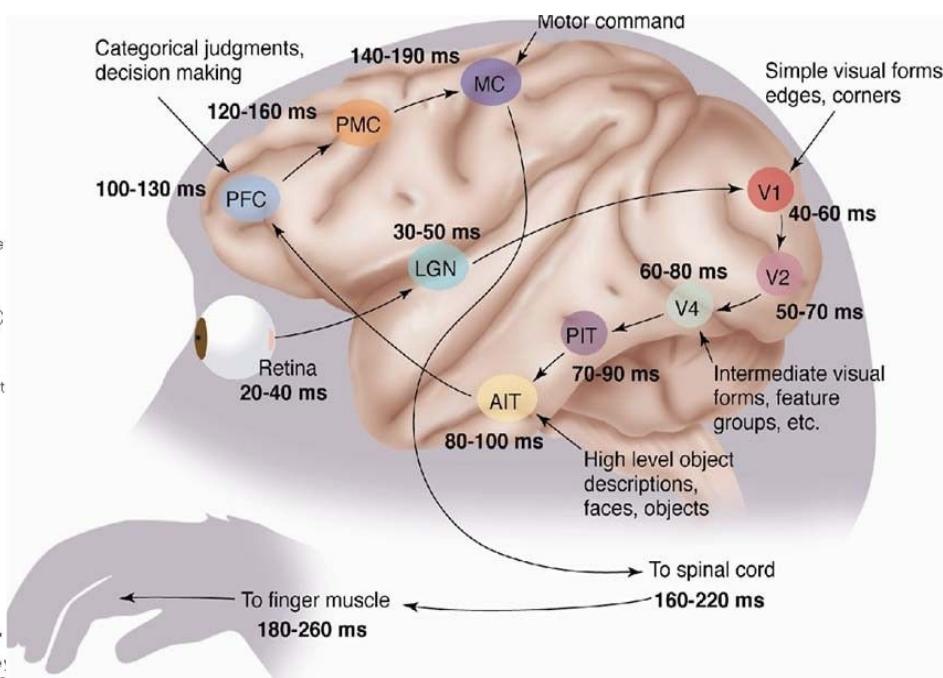

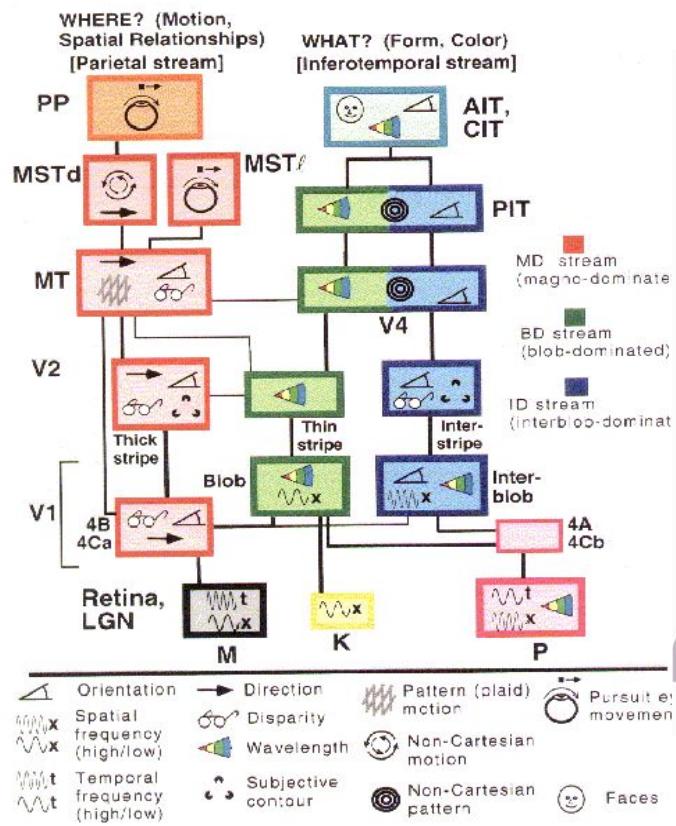

# Learning representations: a challenge for ML, CV, AI, neuroscience, cognitive science...

- How do we learn representations of the perceptual world?
  - How can a perceptual system build itself by looking at the world?
  - How much prior structure is necessary
- ML/AI: how do we learn features or feature hierarchies?
  - What is the fundamental principle? What is the learning algorithm? What is the architecture?
- Neuroscience: how does the cortex learn perception?
  - Does the cortex “run” a single, general learning algorithm? (or a small number of them)
- CogSci: how does the mind learn abstract concepts on top of less abstract ones?
- Deep Learning addresses the problem of learning hierarchical representations with a single algorithm
  - Or perhaps with a few algorithms

# The mammalian visual cortex is hierarchical

- The ventral (recognition) pathway in the visual cortex has multiple stages Retina - LGN - V1 - V2 - V4 - PIT - AIT ....
- Lots of intermediate representations

[picture from Simon Thorpe]

[Gallant & Van Essen]

# Let's be inspired by nature, but not too much

- It's nice imitate Nature,
- But we also need to **understand**
  - How do we know which details are important?
  - Which details are merely the result of evolution, and the constraints of biochemistry?
- For airplanes, we developed aerodynamics and compressible fluid dynamics.
  - We figured that feathers and wing flapping weren't crucial
- **QUESTION:** What is the equivalent of aerodynamics for understanding intelligence?

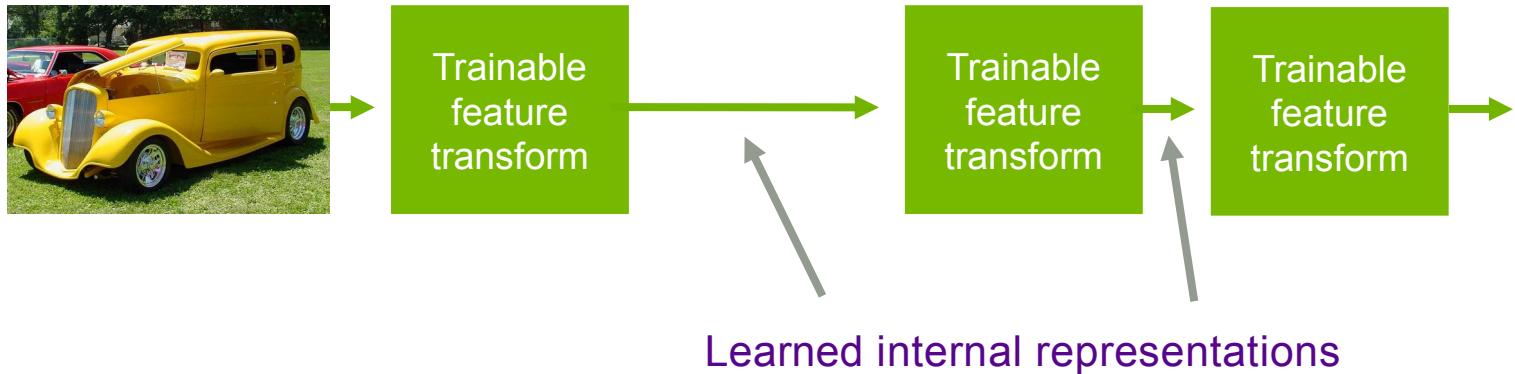

L'Avion III de Clément Ader, 1897

(Musée du CNAM, Paris)

His Eole took off from the ground in 1890, 13 years before the Wright Brothers, but you probably never heard of it.

# Trainable feature hierarchies: end-to-end learning

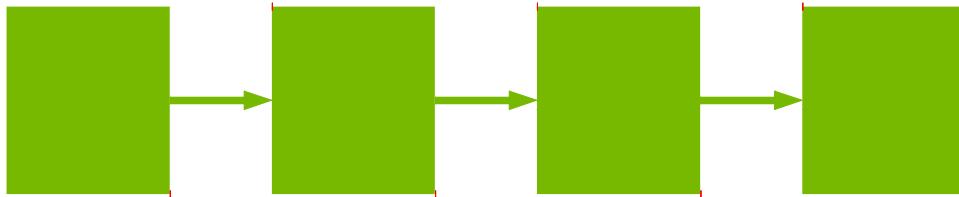

- A hierarchy of trainable feature transforms
  - Each module transforms its input representation into a higher-level one.
  - High-level features are more global and more invariant
  - Low-level features are shared among categories

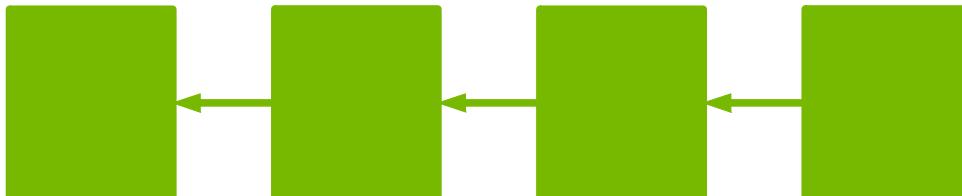

- How can we make all the modules trainable and get them to learn appropriate representations?

# Three types of deep architectures

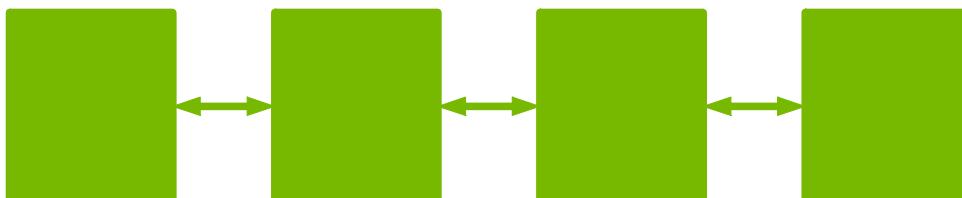

- Feed-forward: multilayer neural nets, convolutional nets

- Feed-back: stacked sparse coding, deconvolutional nets

- Bi-directional: Deep Boltzmann Machines, stacked auto-encoders

# Three types of training protocols

- Purely Supervised
  - Initialize parameters randomly Train in supervised mode
    - Typically with SGD, using backprop to compute gradients
    - Used in most practical systems for speech and image recognition
- Unsupervised, layerwise + supervised classifier on top
  - Train each layer unsupervised, one after the other
  - Train a supervised classifier on top, keeping the other layers fixed
  - Good when very few labeled samples are available
- Unsupervised, layerwise + global supervised fine-tuning
  - Train each layer unsupervised, one after the other
  - Add a classifier layer, and retrain the whole thing supervised
  - Good when label set is poor (e.g. pedestrian detection)
- Unsupervised pre-training often uses regularized auto-encoders

# Do we really need deep architectures?

- **Theoretician's dilemma**: “We can approximate any function as close as we want with shallow architecture. Why would we need deep ones?”

$$y = \sum_{i=1}^P \alpha_i K(X, X^i) \quad y = F(W^1.F(W^0.X))$$

- kernel machines (and 2-layer neural nets) are “universal”.
- Deep learning machines

$$y = F(W^K.F(W^{K-1}.F(\dots.F(W^0.X)\dots)))$$

- **Deep machines are more efficient for representing certain classes of functions**, particularly those involved in visual recognition
  - They can represent more complex functions with less “hardware”
- We need an efficient parameterization of the class of functions that are useful for “AI” tasks (vision, audition, NLP...)

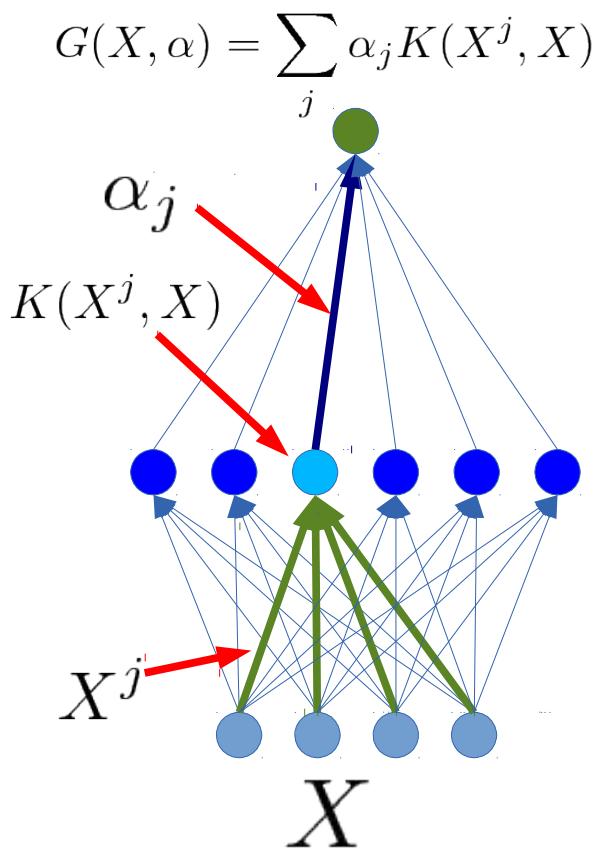

# Why would deep architectures be more efficient?

[Bengio & LeCun 2007 “Scaling Learning Algorithms Towards AI”]

- A deep architecture trades space for time (or breadth for depth)
  - More layers (more sequential computation),
  - But less hardware (less parallel computation).
- Example1: N-bit parity
  - requires  $N-1$  XOR gates in a tree of depth  $\log(N)$ .
  - Even easier if we use threshold gates
  - requires an exponential number of gates if we restrict ourselves to 2 layers (DNF formula with exponential number of minterms).
- Example2: circuit for addition of 2 N-bit binary numbers
  - Requires  $O(N)$  gates, and  $O(N)$  layers using  $N$  one-bit adders with ripple carry propagation.
  - Requires lots of gates (some polynomial in  $N$ ) if we restrict ourselves to two layers (e.g. Disjunctive Normal Form).
  - Bad news: almost all boolean functions have a DNF formula with an exponential number of minterms  $O(2^N)$ .....

# Which models are deep?

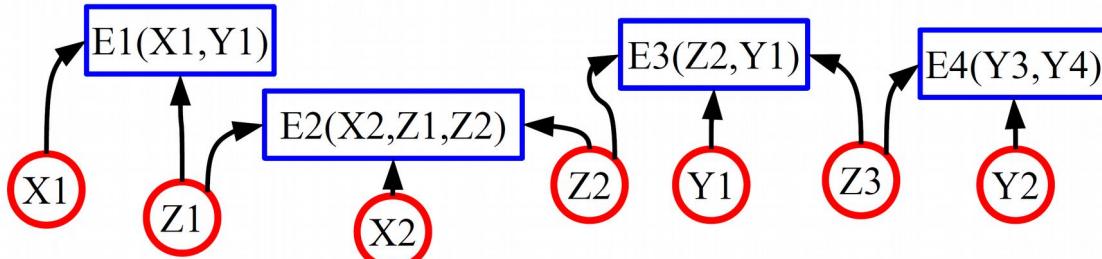

- 2-layer models are not deep (even if you train the first layer)
  - Because there is no feature hierarchy
- Neural nets with 1 hidden layer are not deep
- SVMs and Kernel methods are not deep
  - Layer1: kernels; layer2: linear
  - The first layer is “trained” in with the simplest unsupervised method ever devised: using the samples as templates for the kernel functions.
- Classification trees are not deep
  - No hierarchy of features. All decisions are made in the input space

# Are graphical models deep?

- There is no opposition between graphical models and deep learning.
  - Many deep learning models are formulated as factor graphs
  - Some graphical models use deep architectures inside their factors
- Graphical models can be deep (but most are not). Factor graph: sum of energy functions
  - Over inputs X, outputs Y and latent variables Z. Trainable parameters: W

$$-\log P(X, Y, Z | W) \propto E(X, Y, Z, W) = \sum_i E_i(X, Y, Z, W_i)$$

- Each energy function can contain a deep network
- The whole factor graph can be seen as a deep network

# Deep learning: A theoretician's nightmare?

- Deep Learning involves non-convex loss functions
  - With non-convex losses, all bets are off
  - Then again, every speech recognition system ever deployed has used non-convex optimization (GMMs are non convex).
- But to some of us **all “interesting” learning is non convex**
  - Convex learning is invariant to the order in which sample are presented (only depends on asymptotic sample frequencies).
  - Human learning isn't like that: we learn simple concepts before complex ones. The order in which we learn things matter.

# Deep learning: A theoretician's nightmare?

- No generalization bounds?
  - Actually, the usual VC bounds apply: most deep learning systems have a finite VC dimension
  - We don't have tighter bounds than that.
  - But then again, how many bounds are tight enough to be useful for model selection?
- It's hard to prove anything about deep learning systems
  - Then again, if we only study models for which we can prove things, we wouldn't have speech, handwriting, and visual object recognition systems today.

# Deep learning: A theoretician's paradise?

- Deep learning is about representing high-dimensional data
  - There has to be interesting theoretical questions there what is the geometry of natural signals?
  - Is there an equivalent of statistical learning theory for unsupervised learning?
  - What are good criteria on which to base unsupervised learning?
- Deep learning systems are a form of latent variable factor graph
  - Internal representations can be viewed as latent variables to be inferred, and deep belief networks are a particular type of latent variable models.
  - The most interesting deep belief nets have intractable loss functions: how do we get around that problem?
- Lots of theory at the 2012 IPAM summer school on deep learning
  - Wright's parallel SGD methods, Mallat's “scattering transform”, Osher's “split Bregman” methods for sparse modeling, Morton's “algebraic geometry of DBN”,....

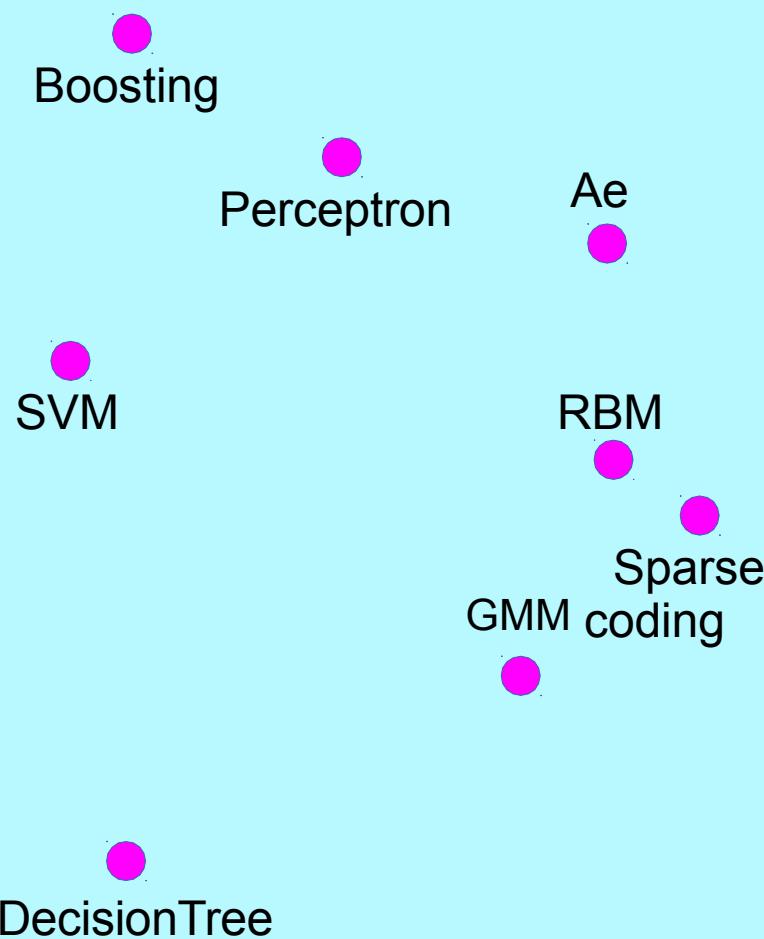

# Deep learning and feature learning today

- Deep learning has been the hottest topic in speech recognition in the last 2 years
  - A few long-standing performance records were broken with deep learning methods
  - Microsoft and google have both deployed dl-based speech recognition system in their products
  - Microsoft, google, IBM, nuance, AT&T, and all the major academic and industrial players in speech recognition have projects on deep learning
- Deep learning is the hottest topic in computer vision
  - Feature engineering is the bread-and-butter of a large portion of the CV community, which creates some resistance to feature learning
  - But the record holders on ImageNet and semantic segmentation are convolutional nets
- Deep learning is becoming hot in natural language processing
- Deep learning/feature learning in applied mathematics
  - The connection with applied math is through sparse coding, non-convex optimization, stochastic gradient algorithms, etc...

# In many fields, feature learning has caused a revolution (methods used in commercially deployed systems)

- Speech Recognition I (late 1980s)
  - Trained mid-level features with Gaussian mixtures (2-layer classifier)
- Handwriting Recognition and OCR (late 1980s to mid 1990s)
  - Supervised convolutional nets operating on pixels
- Face & People Detection (early 1990s to mid 2000s)
  - Supervised convolutional nets operating on pixels (YLC 1994, 2004, Garcia 2004)
  - Haar features generation/selection (Viola-Jones 2001)
- Object Recognition I (mid-to-late 2000s: Ponce, Schmid, Yu, YLC....)
  - Trainable mid-level features (K-means or sparse coding)
- Low-Res Object Recognition: road signs, house numbers (early 2010's)
  - Supervised convolutional net operating on pixels
- Speech Recognition II (circa 2011)
  - Deep neural nets for acoustic modeling
- Object Recognition III, Semantic Labeling (2012, Hinton, YLC,...)
  - Supervised convolutional nets operating on pixels

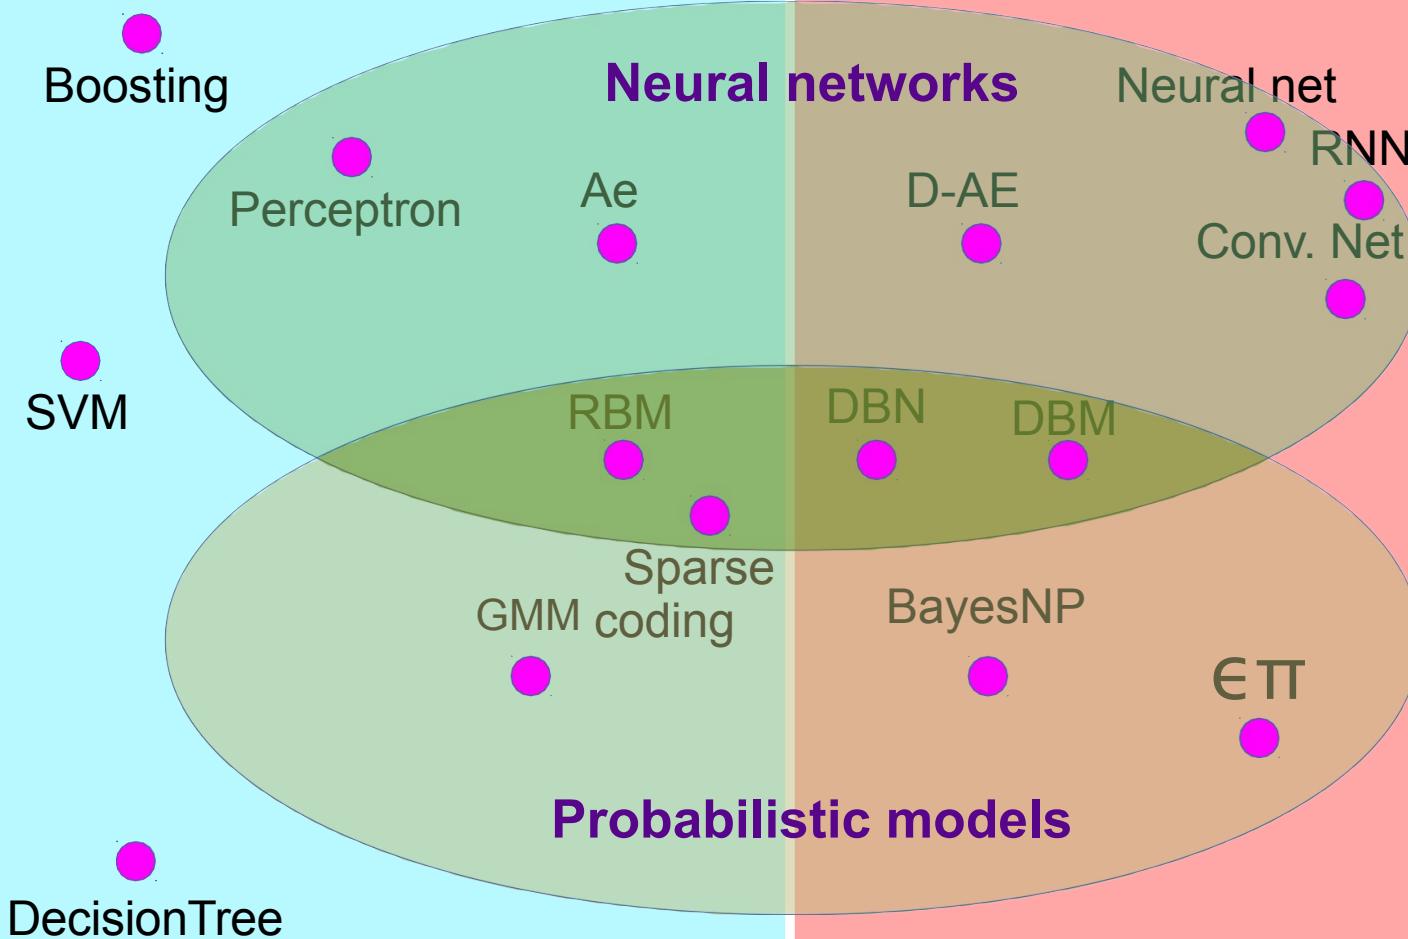

# Shallow

# Deep

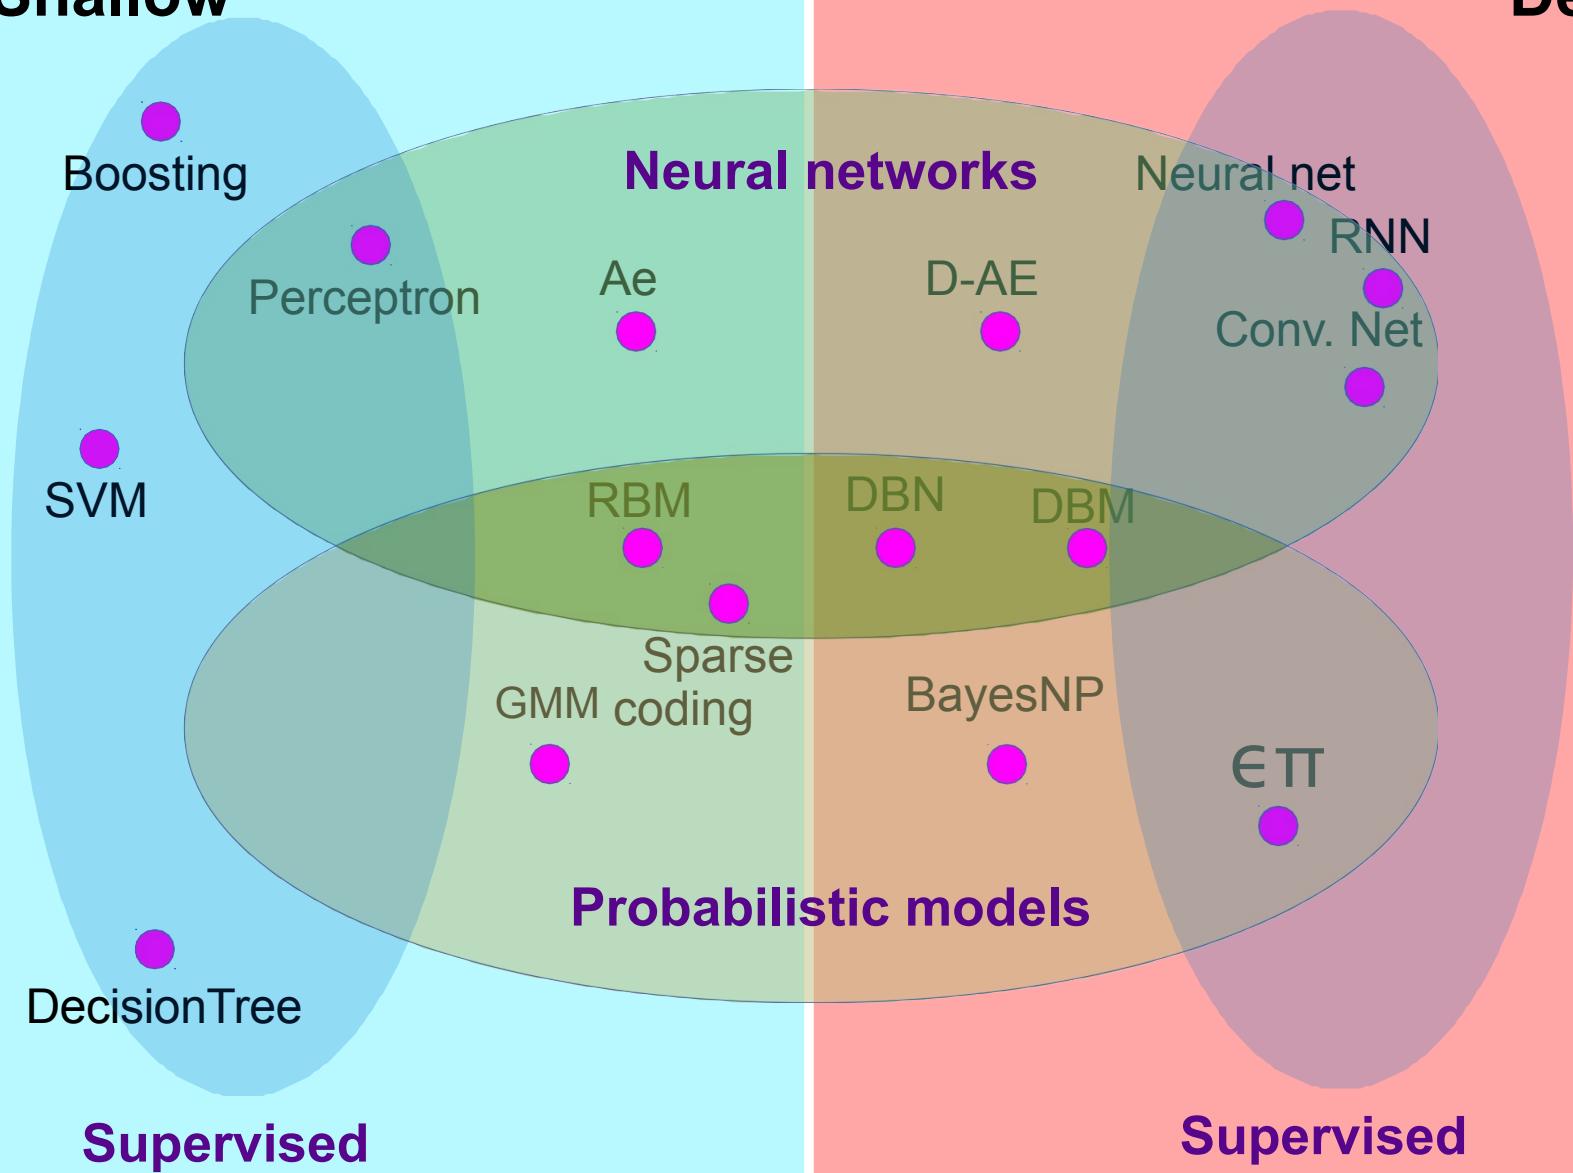

# Shallow

# Deep

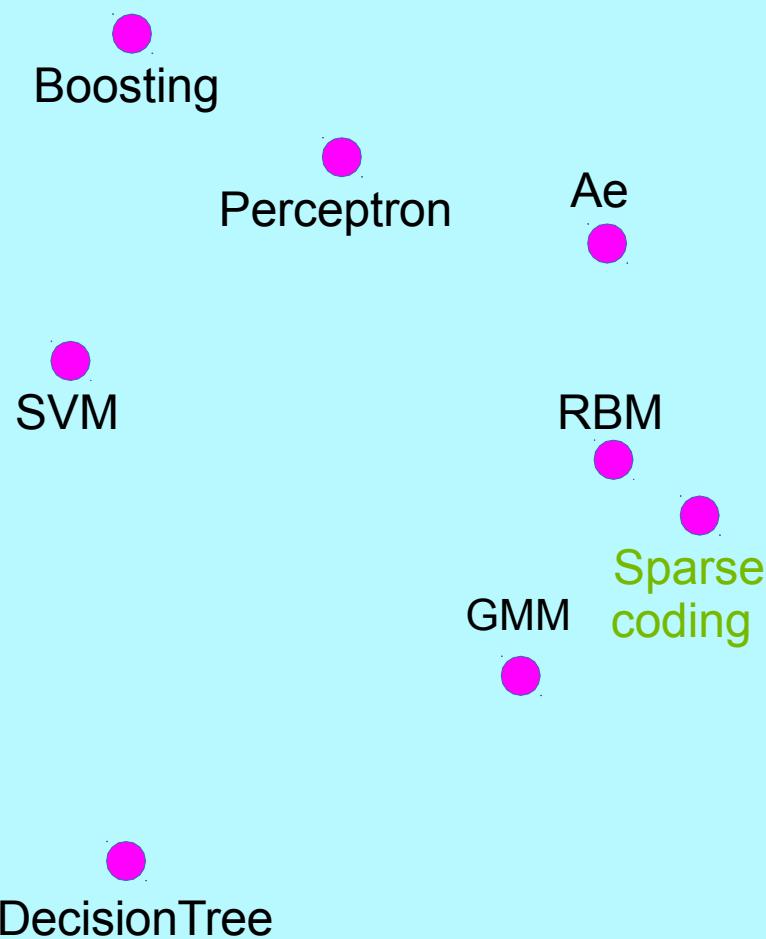

Deep

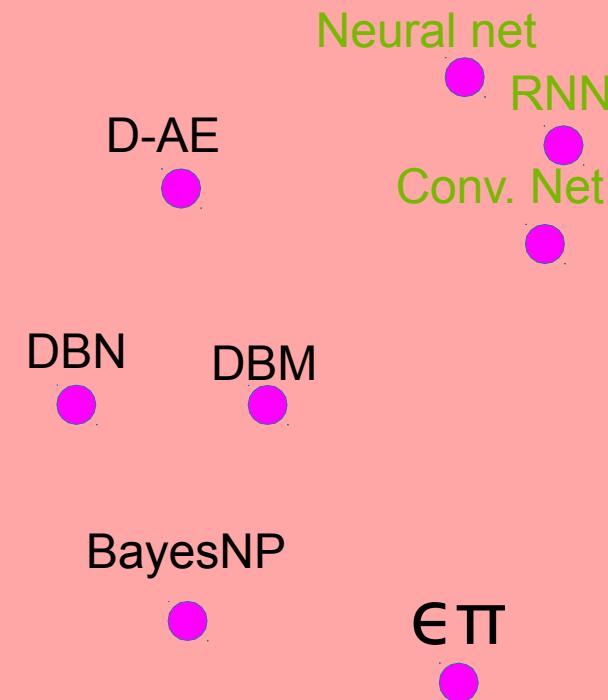

Shallow

# Shallow

# Deep

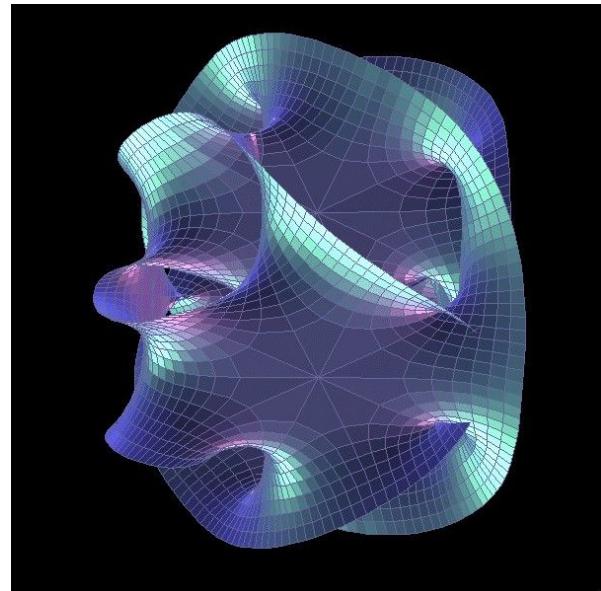

In this talk, we'll focus on the simplest and typically most effective methods

# What are good features?

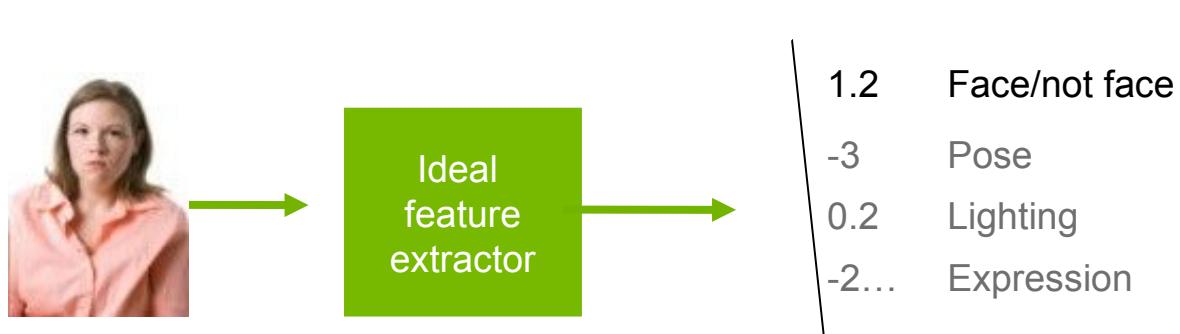

# Discovering the hidden structure in high-dimensional data the manifold hypothesis

- Learning representations of data:
  - Discovering & disentangling the independent explanatory factors
- The manifold hypothesis:
  - Natural data lives in a low-dimensional (non-linear) manifold
  - Because variables in natural data are mutually dependent

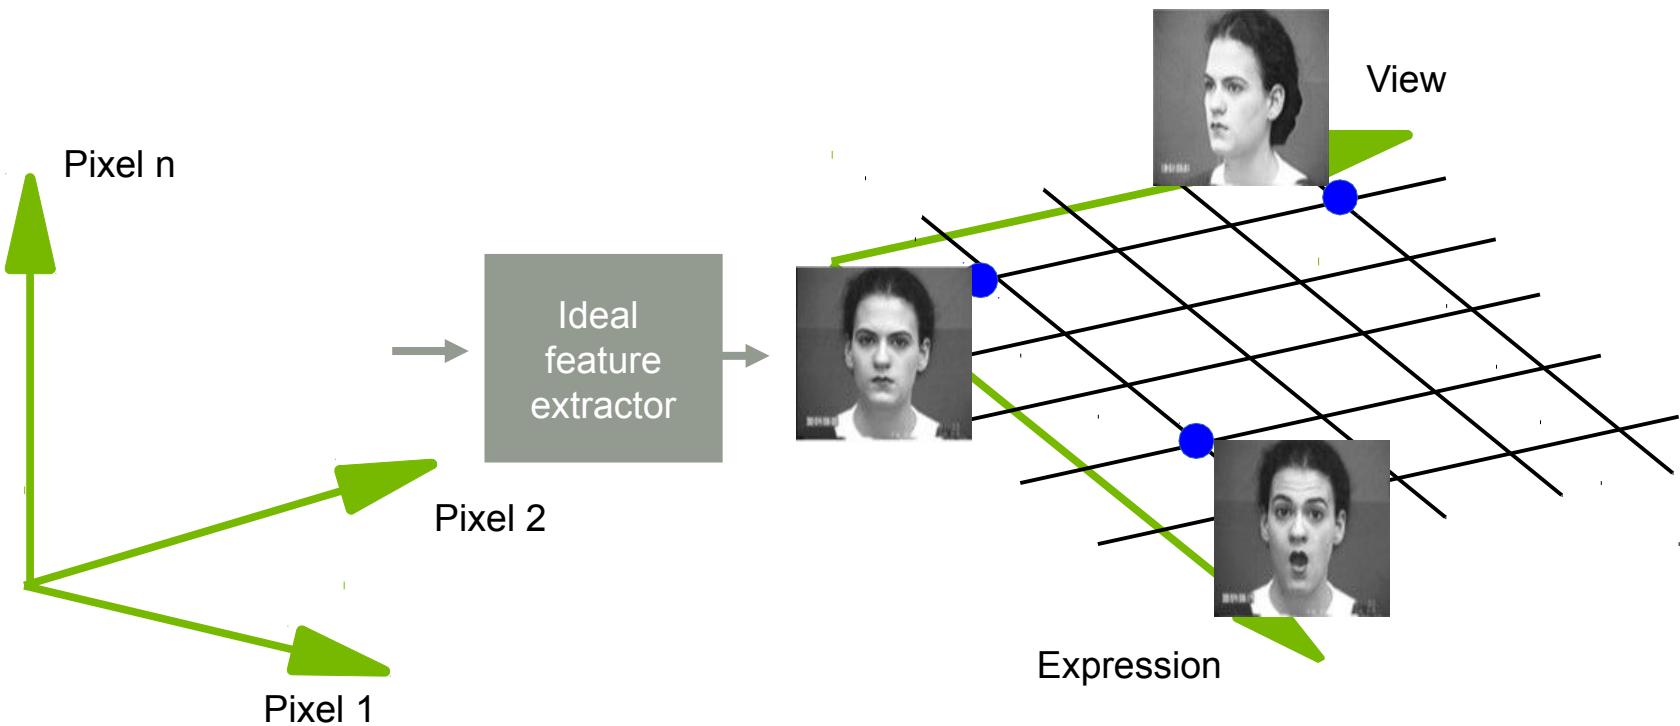

# Discovering the hidden structure in high-dimensional data

- Example: all face images of a person
  - $1000 \times 1000$  pixels = 1,000,000 dimensions
  - But the face has 3 Cartesian coordinates and 3 Euler angles and humans have less than about 50 muscles in the face
  - Hence the manifold of face images for a person has <56 dimensions
- The perfect representations of a face image:
  - Its coordinates on the face manifold
  - Its coordinates away from the manifold
- We do not have good and general methods to learn functions that turns an image into this kind of representation

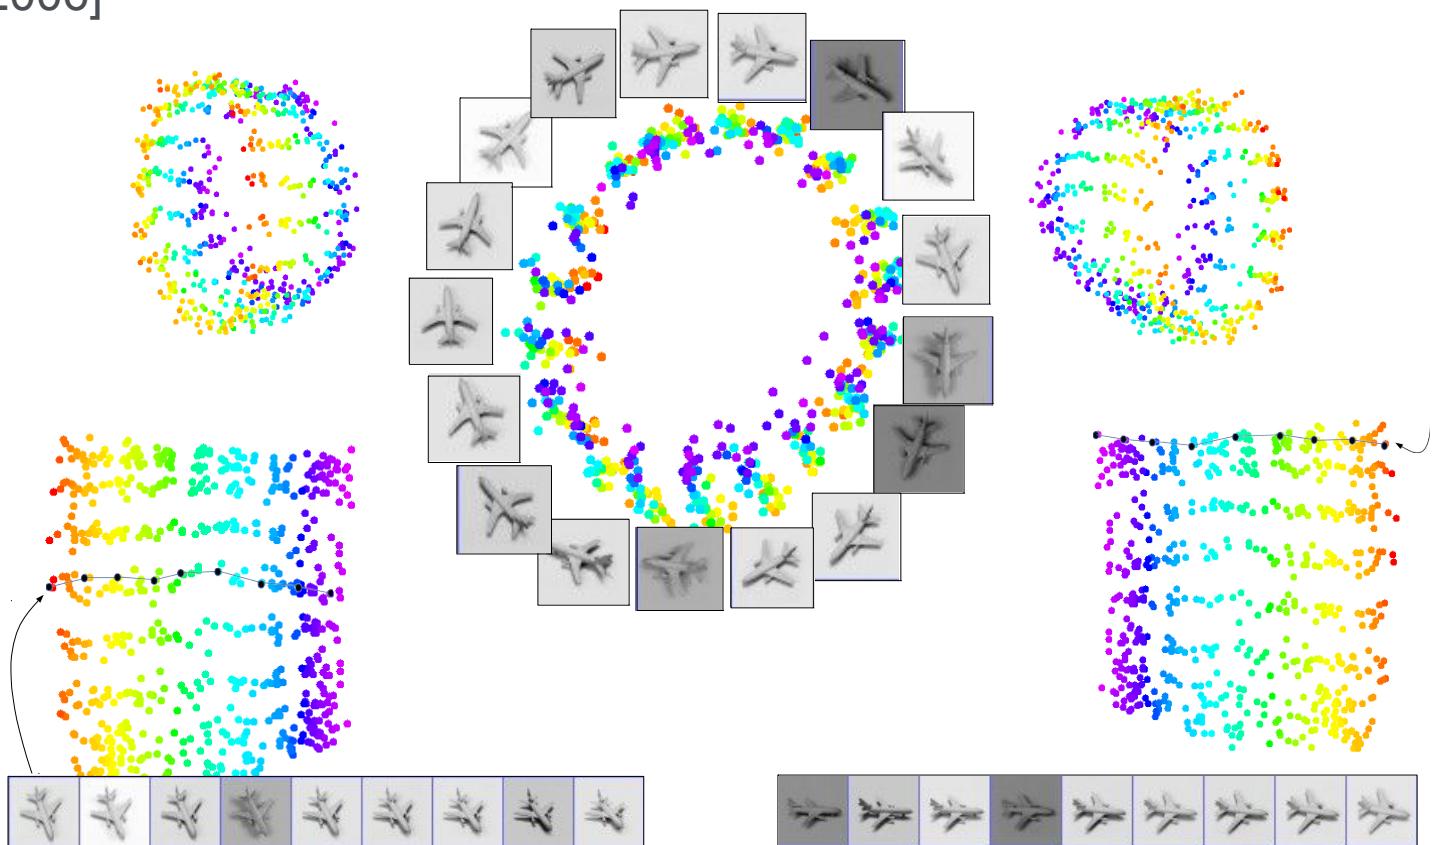

# Disentangling factors of variation

## The ideal disentangling feature extractor

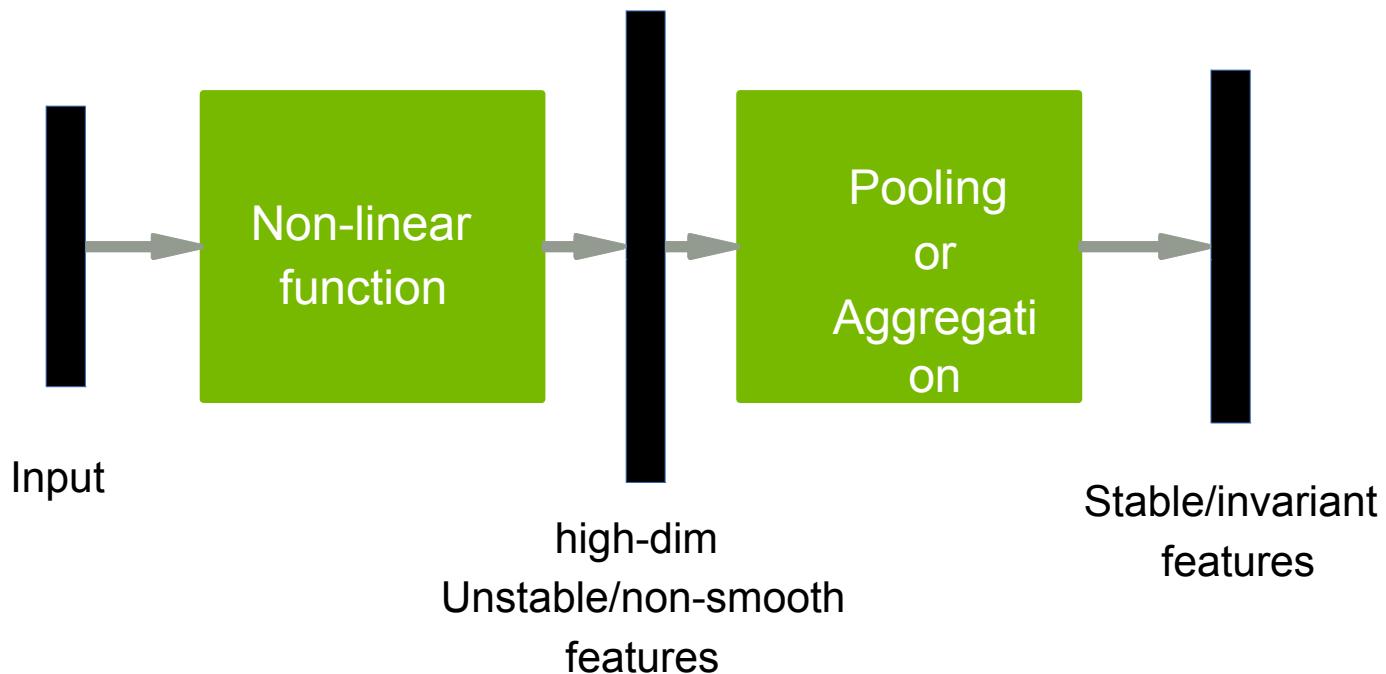

# Data manifold & invariance: Some variations must be eliminated

- Azimuth-Elevation manifold. Ignores lighting. [Hadsell et al. CVPR 2006]

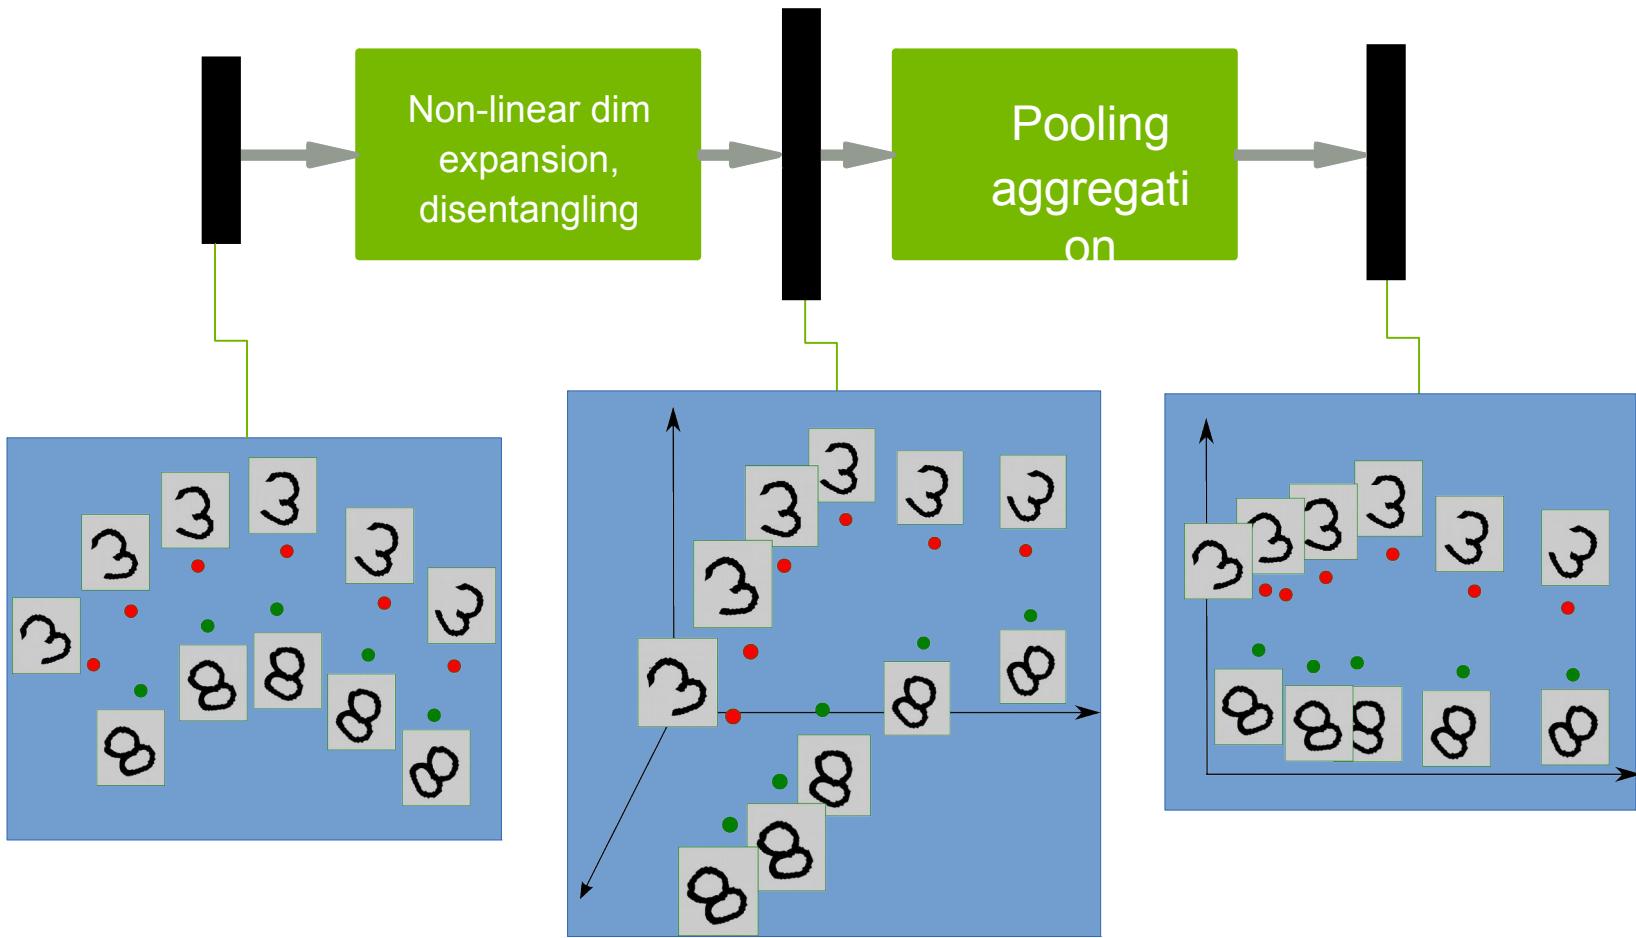

# Basic idea for invariant feature learning

- Embed the input **non-linearly** into a high(er) dimensional space
  - In the new space, things that were non separable may become separable
- Pool regions of the new space together
  - Bringing together things that are semantically similar. Like pooling.

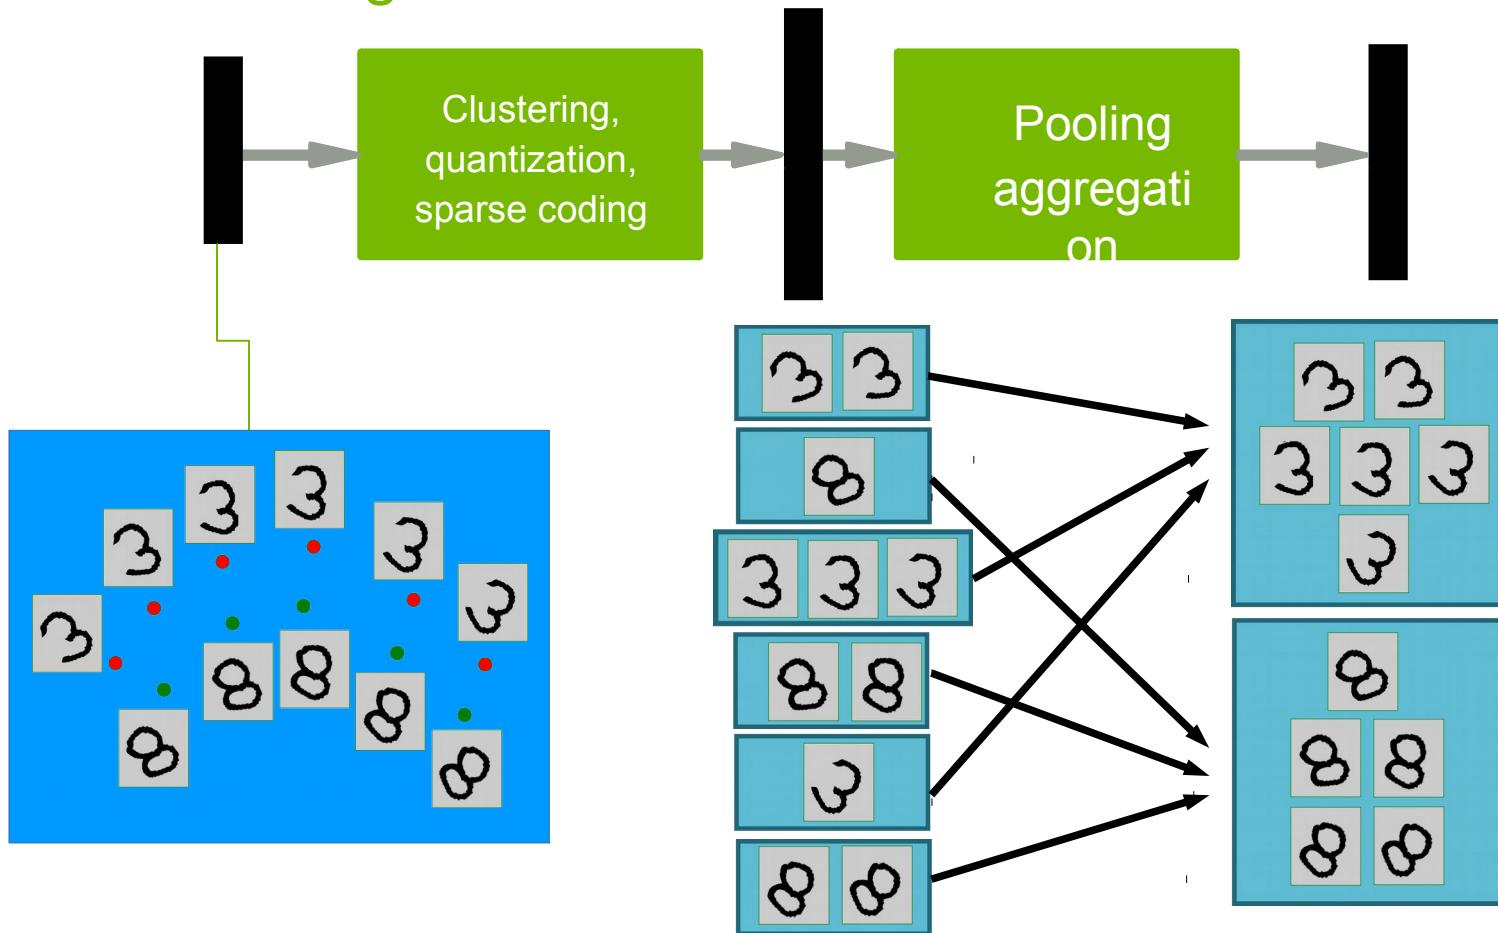

# Non-linear expansion → pooling

## Entangled data manifolds

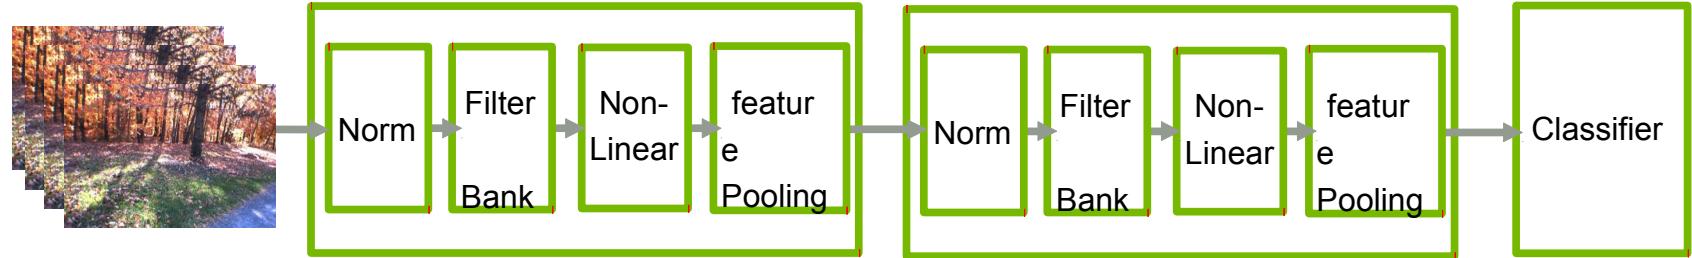

# Sparse non-linear expansion → pooling

Use clustering to break things apart, pool together similar things

# Overall architecture:

Normalization → filter bank → non-linearity → pooling

- Stacking multiple stages of
  - [Normalization → filter bank → non-linearity → pooling].
- **Normalization**: variations on whitening
  - Subtractive: average removal, high pass filtering
  - Divisive: local contrast normalization, variance normalization
- **Filter bank**: dimension expansion, projection on overcomplete basis
- **Non-linearity**: sparsification, saturation, lateral inhibition....
  - Rectification (relu), component-wise shrinkage, tanh, winner-takes-all
- **Pooling**: aggregation over space or feature type
  - $X_i$ ;  $L_p : \sqrt[p]{X_i^p}$ ;  $PROB : \frac{1}{b} \log \left( \sum_i e^{bX_i} \right)$

### UAE: First minister of artificial intelligence don land

19 October 2017

EUROPEAN COMMISSION

Press Release Database

European Commission > Press releases database > Press Release details

European Commission - Press release

Commission proposes to invest EUR 1 billion in world-class European supercomputers

Brussels, 11 January 2018

Andrus Ansip, European Commission Vice-President for the Digital Single Market, said: "Supercomputers are the engine to power the digital economy. It is a tough race and today the EU is lagging behind: we do not have any supercomputers in the world's top-ten. With the EuroHPC initiative we want to give European researchers and companies world-leading supercomputer capacity by 2020 – to develop technologies such as artificial intelligence and build the future's everyday applications in areas like health, security or engineering."

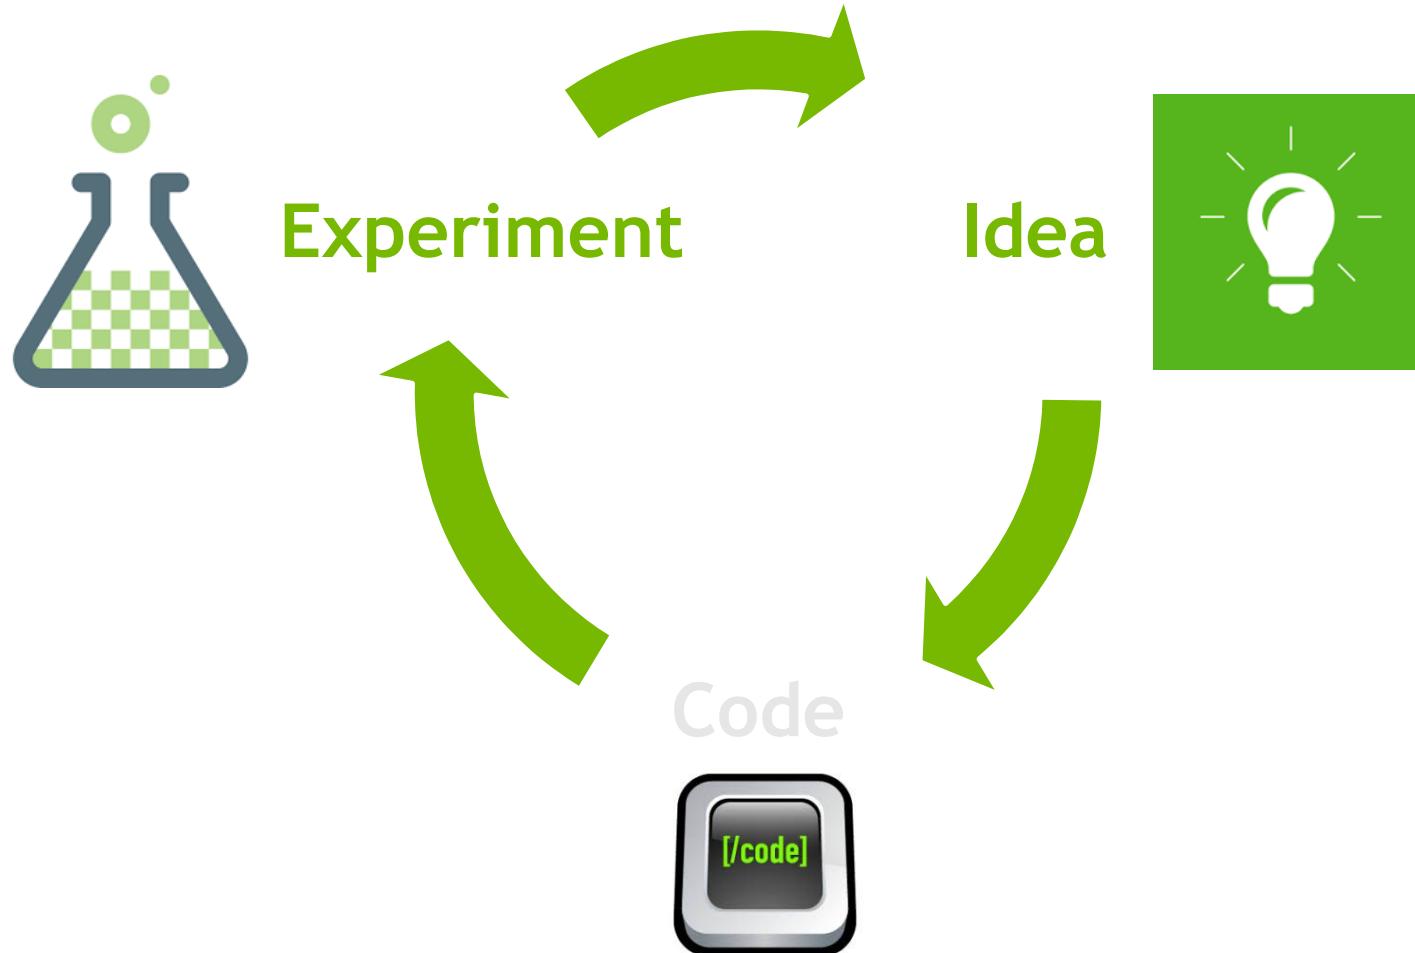

# IMPLICATIONS

## Good and bad news

- ▶ The good news: Requirements are predictable.
  - ▶ We can predict how much data we will need
  - ▶ We can predict how much computing power we will need
- ▶ The **bad** news: The values can be significant.

# IMPLICATIONS

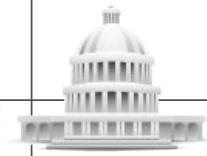

Experimental Nature of Deep Learning - Unacceptable training time

# IMPLICATIONS

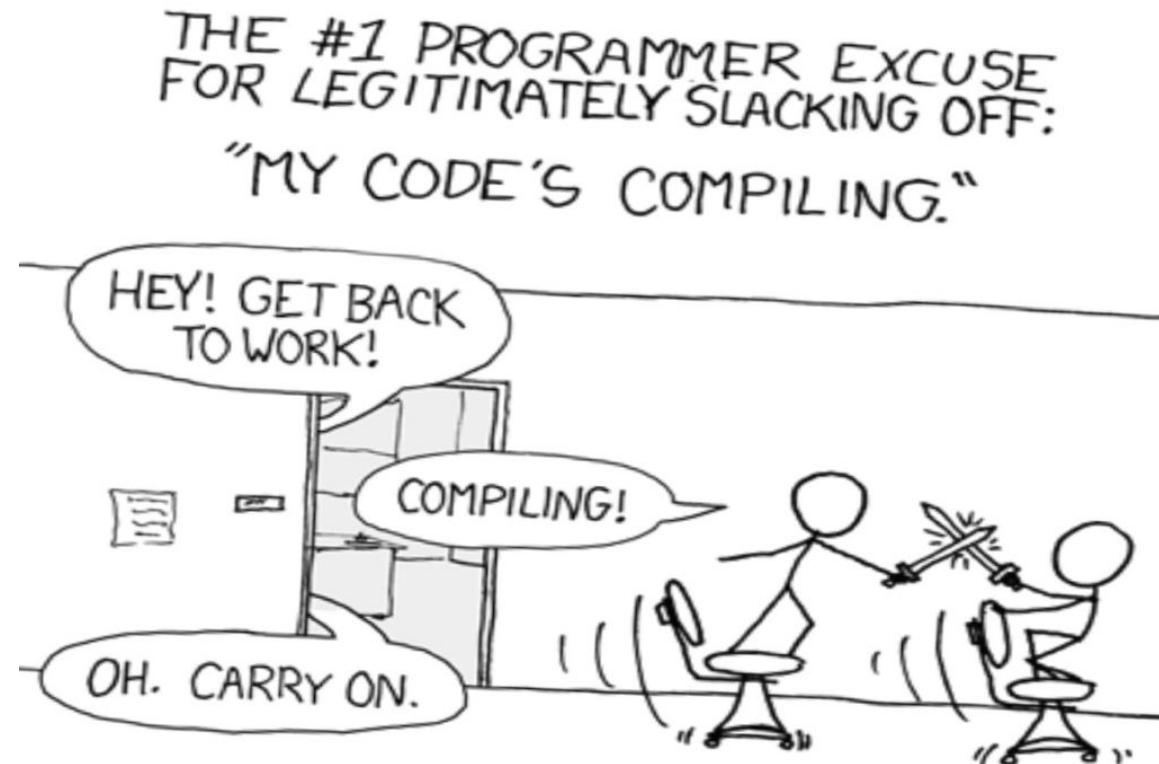

## Automotive example

Majority of useful problems are too complex for a single GPU training

	VERY CONSERVATIVE	CONSERVATIVE
Fleet size (data capture per hour)	100 cars / 1TB/hour	125 cars / 1.5TB/hour
Duration of data collection	260 days * 8 hours	325 days * 10 hours
Data Compression factor	0.0005	0.0008
Total training set	104 TB <small>100 TERABYTES EQUALS 600 MILLION BOOKS OR 18 TIMES THE PRINTED COLLECTION OF THE LIBRARY OF CONGRESS</small>	437.5 TB
InceptionV3 training time (with 1 Pascal GPU)	9.1 years	42.6 years  
AlexNet training time (with 1 Pascal GPU)	 1.1 years 	 5.4 years 

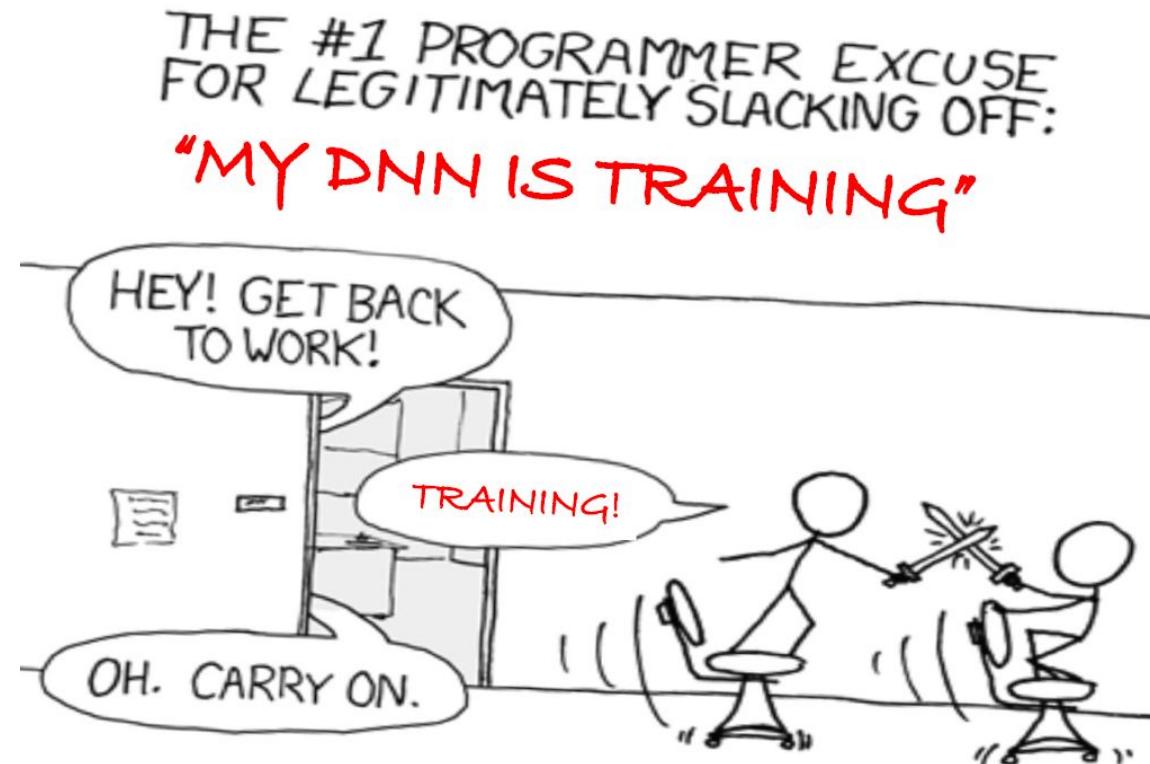

# CONCLUSIONS

What does your team do in the mean time

# CONCLUSIONS

What does your team do in the mean time

# CONCLUSIONS

Need to scale the training process for a single job

	VERY CONSERVATIVE	CONSERVATIVE	Training From Months or Years
1 NVIDIA DGX-1	Total training set	104 TB	487.5 TB
	InceptionV3 (one DGX-1V)	166 days (5+ months)	778 days (2+ years)
10 NVIDIA DGX-1's	AlexNet (one DGX-1V)	21 days (3 weeks)	98 days (3 months)
	InceptionV3 (10 DGX-1V's)	16 days (2+ weeks)	77 days (11 weeks)
10 NVIDIA DGX-1's	AlexNet (10 DGX-1V's)	2.1 days	To Weeks or Days
		9.8 days

# NON CONVEX COST FUNCTIONS

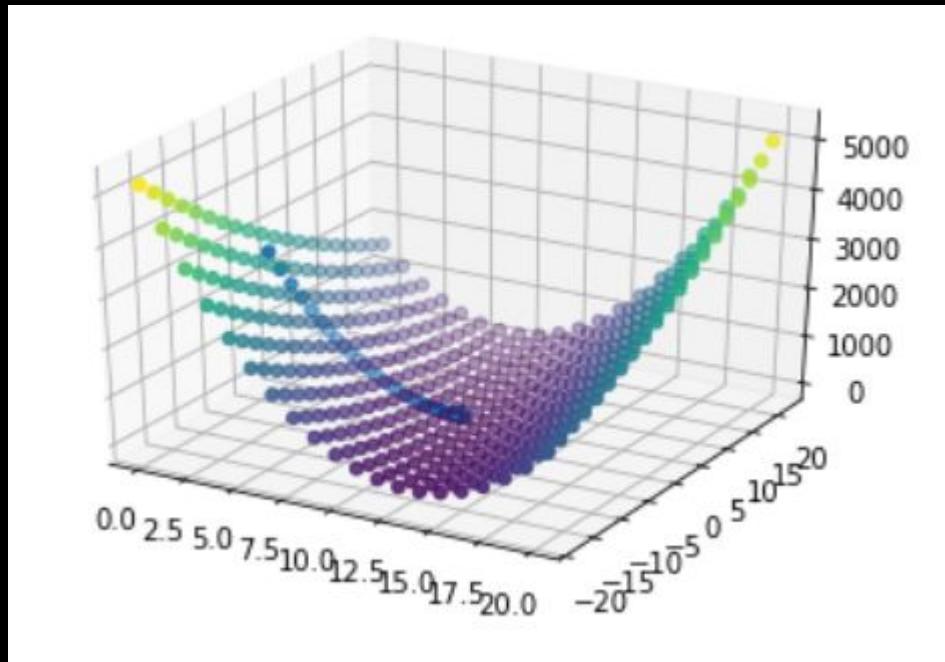

Those differences make the optimization problem much more difficult

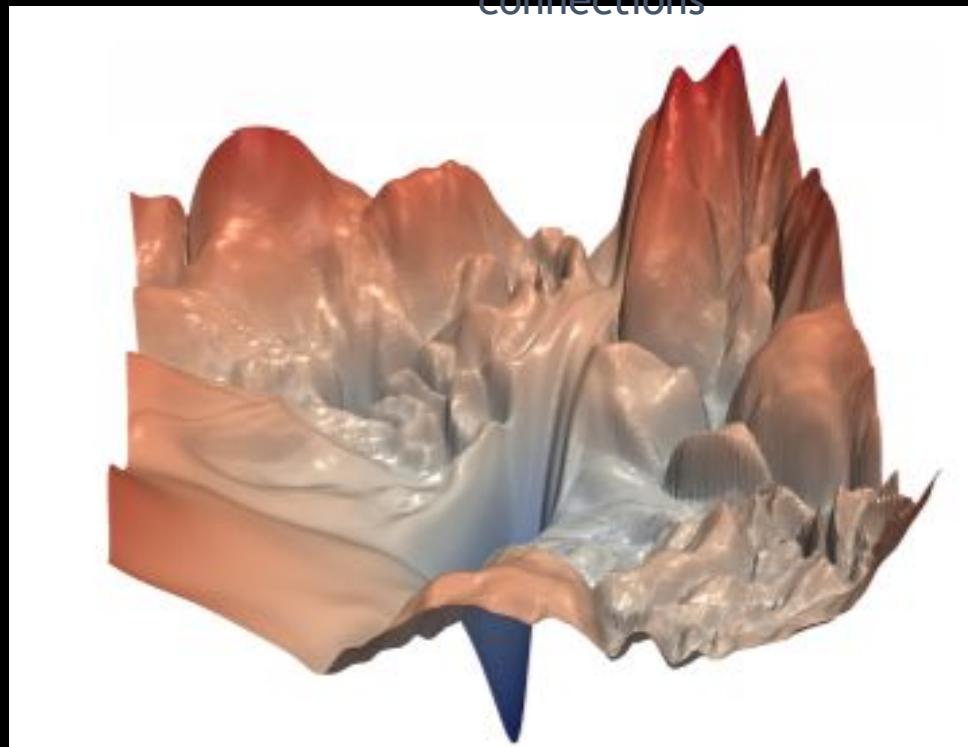

# NON CONVEX COST FUNCTIONS

Those differences make the optimization problem much more difficult

Linear Neuron cost function

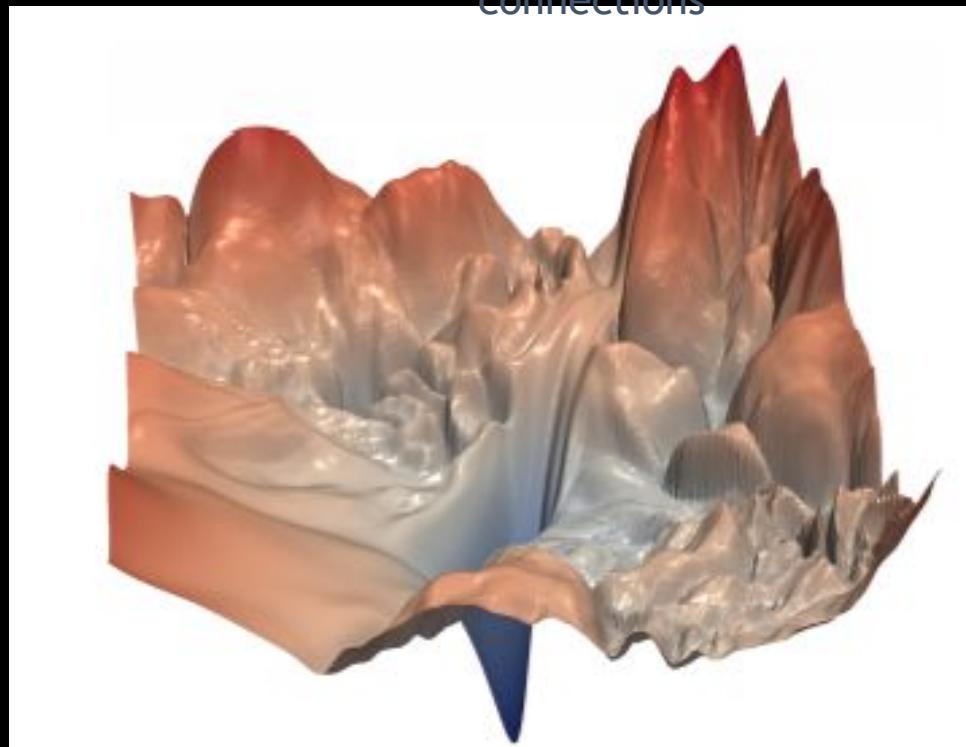

ResNet 56 cost function projection to 3D - no skip connections

# NON CONVEX COST FUNCTIONS

Those differences make the optimization problem much more difficult

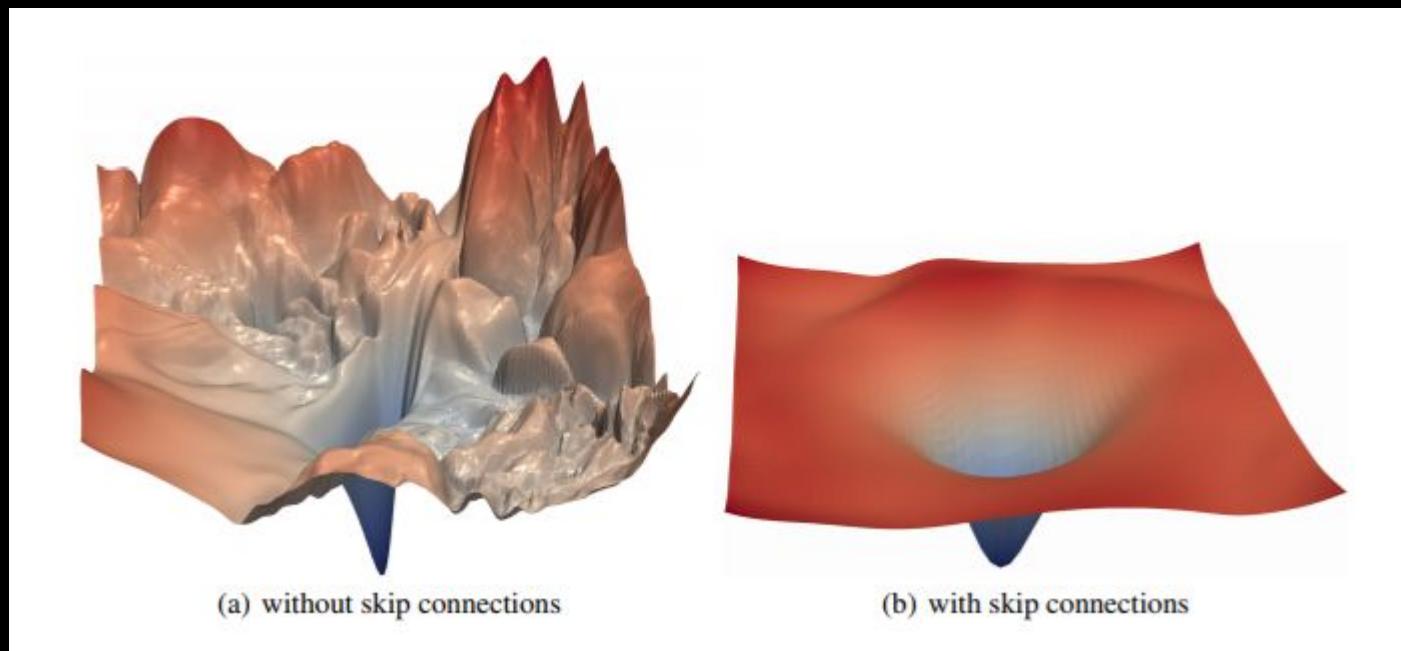

ResNet 56 cost function projection to 3D - no skip connections

Why do we succeed in finding  
good local minima?

# NON CONVEX COST FUNCTIONS

Recent advances such as Residual Connections simplify the optimization problem

# OPTIMISATION

The approach is the same though

- Define a model (multilayer neural network)
- Define a cost function (problem specific)
- Iteratively:
  - Calculate the gradient of the cost function (the algorithm used to obtain the gradient is called backpropagation)
  - Update the model parameters (again using one of many optimisation algorithms)

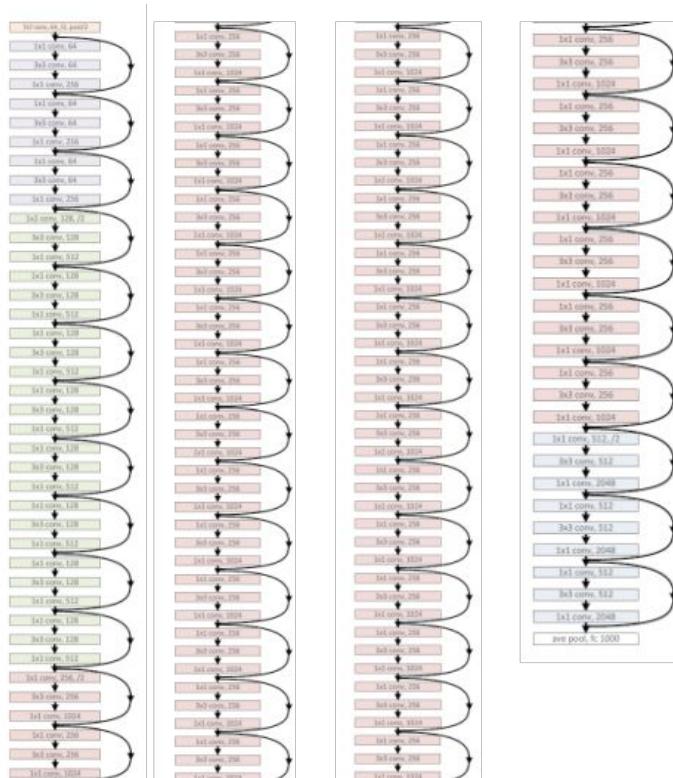

# BACKPROPAGATION

How do we compute the gradient of such a complex function?

$$y = f(u), \ u = g(x)$$

Therefore,  $y = (f \circ g)(x)$

$$\frac{dy}{dx} = \frac{dy}{du} \cdot \frac{du}{dx}$$

# BACKPROPAGATION

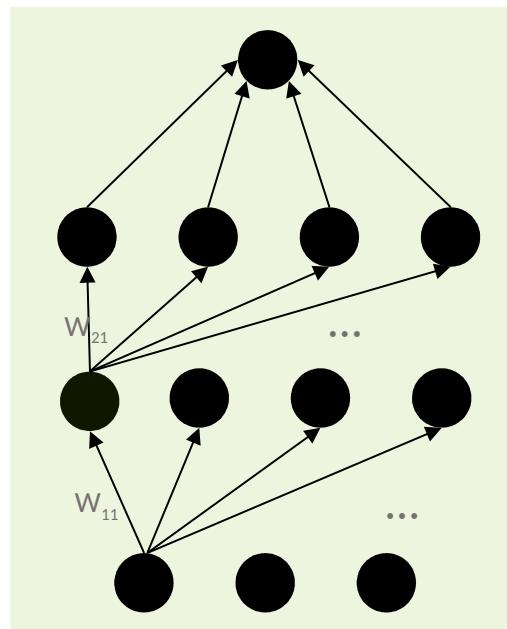

Automatic differentiation

- In practice this is rarely if ever done manually as all of the deep learning frameworks come with:
  - A suite of prebuild optimisation algorithms
  - An automatic differentiation functionality
- A very useful side effect is a fact that you can embed ANY DIFFERENTIABLE code into your neural network!

# OPTIMIZATION

Let's start with a simplest neural network - multilayer perceptron

- We will build a simple (2 hidden layers) neural network - multilayer perceptron (no nonlinearity)
- We will work with the MNIST dataset
- Our goal is to find best model parameters to fit the data

## ▼ CPU version - MNIST digit classification in TensorFlow 2.0

**IMPORTANT: Runtime -> Change runtime -> None**

Now, we will see how can we perform the MNIST handwritten digits classification using tensorflow 2.0. It hardly a few lines of code compared to the tensorflow 1.x. As we learned, tensorflow 2.0 uses as keras as its high-level API, we just need to add tf.keras to the keras code.

## ▼ Enabling and testing the environment

## ▼ Import the libraries:

```
import warnings
warnings.filterwarnings('ignore')

import tensorflow as tf
```

## ▼ Check Tensorflow version

```
print(tf.__version__)
```

## 2.4.1

### ▼ Load the dataset:

```
mnist = tf.keras.datasets.mnist
```

### ▼ Create a train and test set:

```
(x_train,y_train), (x_test, y_test) = mnist.load_data()
```

### ▼ Normalize data ...

... the x values by diving with maximum value of x which is 255 and convert them to float:

```
x_train, x_test = tf.cast(x_train/255.0, tf.float32), tf.cast(x_test/255.0, tf.flo
```

convert y values to int:

```
y_train, y_test = tf.cast(y_train,tf.int64),tf.cast(y_test,tf.int64)
```

### ▼ Create the model

Define the sequential model:

Define the sequential model:

```
model = tf.keras.models.Sequential()
```

Add the layers - We use a three-layered network. We apply ReLU activation at the first two layers and in the final output layer we apply softmax function:

```
model.add(tf.keras.layers.Flatten())
model.add(tf.keras.layers.Dense(256, activation="relu"))
model.add(tf.keras.layers.Dense(128, activation="relu"))
model.add(tf.keras.layers.Dense(10, activation="softmax"))
```

Compile the model with Stochastic Gradient Descent, that is 'sgd' (we will learn about this in the next chapter) as optimizer and sparse\_categorical\_crossentropy as loss function and with

accuracy as a metric:

```
model.compile(optimizer='sgd', loss='sparse_categorical_crossentropy', metrics=['a
```

- List item
- List item

## ▼ Train

Train the model for 10 epochs with batch\_size as 32:

```
history = model.fit(x_train, y_train, batch_size=32, epochs=10)
```

```
Epoch 1/10
1875/1875 [=====] - 5s 2ms/step - loss: 1.0382 - acc: 0.0000e+00
Epoch 2/10
1875/1875 [=====] - 5s 2ms/step - loss: 0.3054 - acc: 0.0000e+00
Epoch 3/10
1875/1875 [=====] - 5s 3ms/step - loss: 0.2385 - acc: 0.0000e+00
Epoch 4/10
1875/1875 [=====] - 5s 3ms/step - loss: 0.2010 - acc: 0.0000e+00
Epoch 5/10
1875/1875 [=====] - 5s 3ms/step - loss: 0.1730 - acc: 0.0000e+00
Epoch 6/10
1875/1875 [=====] - 5s 3ms/step - loss: 0.1538 - acc: 0.0000e+00
Epoch 7/10
1875/1875 [=====] - 5s 3ms/step - loss: 0.1348 - acc: 0.0000e+00
Epoch 8/10
1875/1875 [=====] - 5s 2ms/step - loss: 0.1239 - acc: 0.0000e+00
Epoch 9/10
1875/1875 [=====] - 5s 2ms/step - loss: 0.1116 - acc: 0.0000e+00
Epoch 10/10
1875/1875 [=====] - 5s 2ms/step - loss: 0.1017 - acc: 0.0000e+00
```

## ▼ Show the structure of the model

```
model.summary()
```

Model: "sequential"

Layer (type)	Output Shape	Param #
flatten (Flatten)	(32, 784)	0
dense (Dense)	(32, 256)	200960
dense_1 (Dense)	(32, 128)	32896
dense_2 (Dense)	(32, 10)	1290
<hr/>		
Total params: 235,146		

Trainable params: 235,146  
Non-trainable params: 0

---

## ▼ Evaluate

Evaluate the model on test sets:

```
model.evaluate(x_test, y_test)
```

```
313/313 [=====] - 1s 1ms/step - loss: 0.1082 - accur  
[0.10815522819757462, 0.9682999849319458]

## ▼ TPU version - MNIST digit classification in TensorFlow 2.0

### IMPORTANT: Runtime -> Change runtime -> TPU

Now, we will see how can we perform the MNIST handwritten digits classification using tensorflow 2.0. It hardly a few lines of code compared to the tensorflow 1.x. As we learned, tensorflow 2.0 uses as keras as its high-level API, we just need to add tf.keras to the keras code.

## ▼ Enabling and testing the TPU

First, you'll need to enable TPUs for the notebook:

- Navigate to Edit → Notebook Settings
- select TPU from the Hardware Accelerator drop-down

Next, we'll check that we can connect to the TPU:

```
%tensorflow_version 2.x
import tensorflow as tf
print("Tensorflow version " + tf.__version__)

try:
    tpu = tf.distribute.cluster_resolver.TPUClusterResolver() # TPU detection
    print('Running on TPU ', tpu.cluster_spec().as_dict()['worker'])
except ValueError:
    raise BaseException('ERROR: Not connected to a TPU runtime; please see the previous section')

tf.config.experimental_connect_to_cluster(tpu)
tf.tpu.experimental.initialize_tpu_system(tpu)
tpu_strategy = tf.distribute.experimental.TPUStrategy(tpu)

## Compare with training results on GPU

Epoch 1/10 1875/1875 [=====] - 6s 2ms/step - loss: 0.9975 - accuracy: 0.7304

Epoch 2/10 1875/1875 [=====] - 4s 2ms/step - loss: 0.3008 - accuracy: 0.9134

Epoch 3/10 1875/1875 [=====] - 4s 2ms/step - loss: 0.2401 - accuracy: 0.9320

Epoch 4/10 1875/1875 [=====] - 4s 2ms/step - loss: 0.2071 - accuracy: 0.9423

```
Epoch 5/10 1875/1875 [=====] - 4s 2ms/step - loss: 0.1794 -  
accuracy: 0.9492  
Epoch 6/10 1875/1875 [=====] - 4s 2ms/step - loss: 0.1576 -  
accuracy: 0.9548  
Epoch 7/10 1875/1875 [=====] - 4s 2ms/step - loss: 0.1393 -  
accuracy: 0.9613  
Epoch 8/10 1875/1875 [=====] - 4s 2ms/step - loss: 0.1309 -  
accuracy: 0.9628  
Epoch 9/10 1875/1875 [=====] - 4s 2ms/step - loss: 0.1119 -  
accuracy: 0.9680  
Epoch 10/10 1875/1875 [=====] - 4s 2ms/step - loss: 0.1042 -
```

## ▼ Evaluate

Evaluate the model on test sets:

```
model.evaluate(x_test, y_test)
```

```
313/313 [=====] - 3s 9ms/step - loss: 0.1062 - accur  
[0.10615649074316025, 0.968500018119812]
```

## ▼ Compare with training results on GPU

```
313/313 [=====] - 1s 2ms/step - loss: 0.1077 - accuracy: 0.9671  
[0.10774651169776917, 0.9671000242233276]
```

The results are nearly the same up to 3rd (loss) and 4th (accuracy) significant number after the decimal point.

# ▼ Deep Learning Basics

## Main Types of Deep Neural Networks

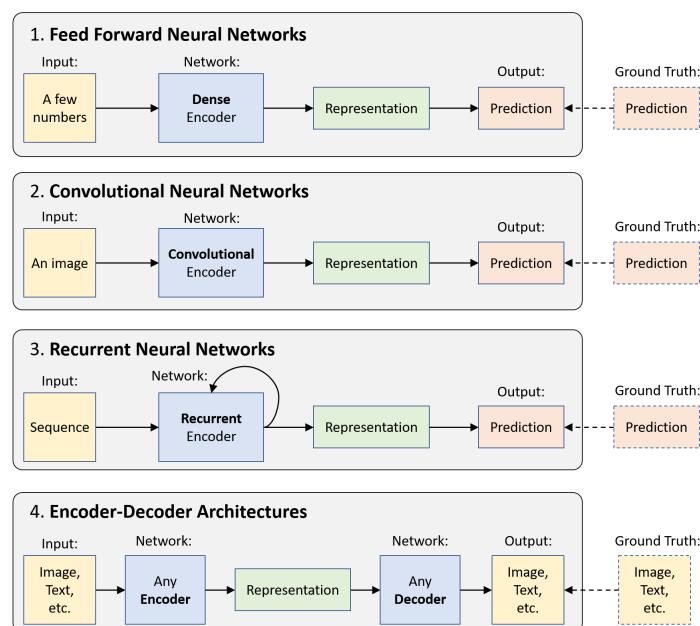

based on (C) [MIT Deep Learning](#) course

This tutorial accompanies the [lecture on Deep Learning Basics](#) given as part of [MIT Deep Learning](#). Acknowledgement to amazing people involved is provided throughout the tutorial and at the end. You can watch the video on YouTube:

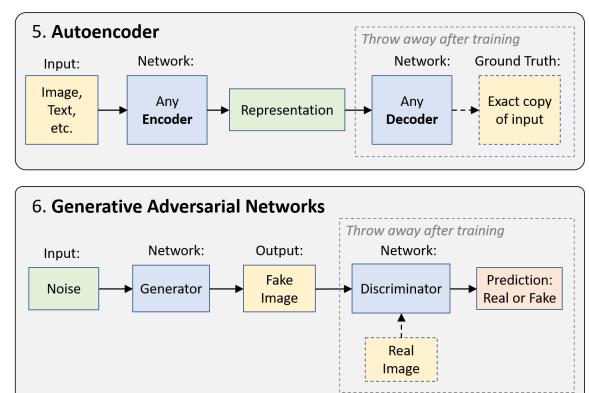

In this tutorial, we mention seven important types/concepts/approaches in deep learning, introducing the first 2 and providing pointers to tutorials on the others. Here is a visual representation of the seven:

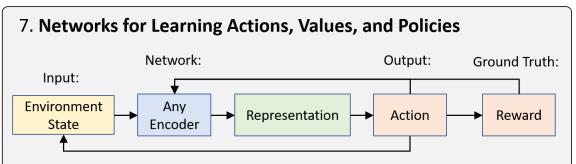

### Supervised Learning

### Unsupervised Learning

### Reinforcement Learning

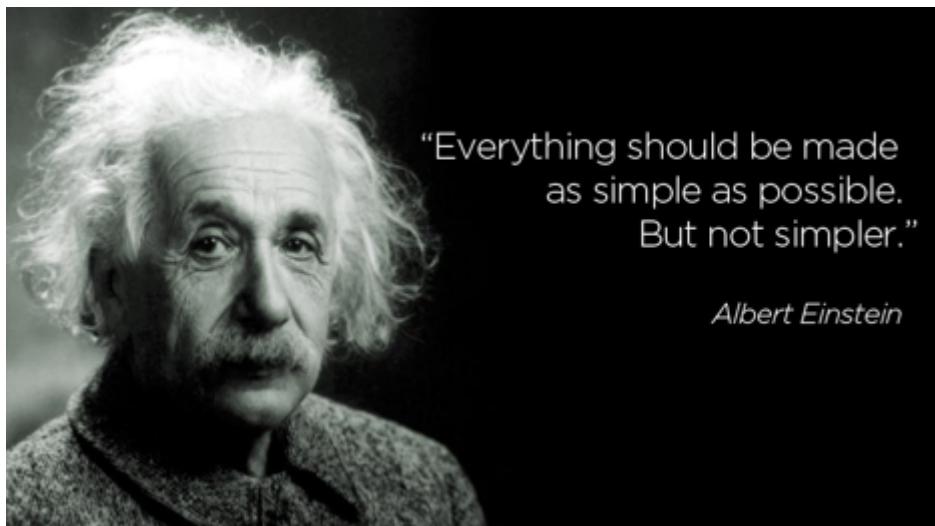

At a high-level, neural networks are either encoders, decoders, or a combination of both. Encoders find patterns in raw data to form compact, useful representations. Decoders generate new data or high-resolution useful information from those representations. As the lecture describes, deep learning discovers ways to **represent** the world so that we can reason about it. The rest is clever methods that help us deal effectively with visual information, language, sound (#1-6) and even act in a world based on this information and occasional rewards (#7).

1. **Feed Forward Neural Networks (FFNNs)** - classification and regression based on features.  
See [Part 1](#) of this tutorial for an example.
2. **Convolutional Neural Networks (CNNs)** - image classification, object detection, video action recognition, etc. See [Part 2](#) of this tutorial for an example.
3. **Recurrent Neural Networks (RNNs)** - language modeling, speech recognition/generation, etc. See [this TF tutorial on text generation](#) for an example.
4. **Encoder Decoder Architectures** - semantic segmentation, machine translation, etc. See [our tutorial on semantic segmentation](#) for an example.
5. **Autoencoder** - unsupervised embeddings, denoising, etc.
6. **Generative Adversarial Networks (GANs)** - unsupervised generation of realistic images, etc. See [this TF tutorial on DCGANs](#) for an example.
7. **Deep Reinforcement Learning** - game playing, robotics in simulation, self-play, neural architecture search, etc. We'll be releasing notebooks on this soon and will link them here.

There are selective omissions and simplifications throughout these tutorials, hopefully without losing the essence of the underlying ideas. See Einstein quote...

## ▼ Part 0: Prerequisites:

We recommend that you run this notebook in the cloud on Google Colab (see link with icon at the top) if you're not already doing so. It's the simplest way to get started. You can also [install TensorFlow locally](#). But, again, simple is best (with caveats):

[tf.keras](#) is the simplest way to build and train neural network models in TensorFlow. So, that's what we'll stick with in this tutorial, unless the models necessitate a lower-level API.

Note that there's [tf.keras](#) (comes with TensorFlow) and there's [Keras](#) (standalone). You should be using [tf.keras](#) because (1) it comes with TensorFlow so you don't need to install anything extra and (2) it comes with powerful TensorFlow-specific features.

```

# TensorFlow and tf.keras
import tensorflow as tf
from tensorflow import keras
from tensorflow.keras.layers import Conv2D, MaxPooling2D, Dropout, Flatten, Dense

# Commonly used modules
import numpy as np
import os
import sys

# Images, plots, display, and visualization
import matplotlib.pyplot as plt
import pandas as pd
import seaborn as sns
import cv2
import IPython
from six.moves import urllib

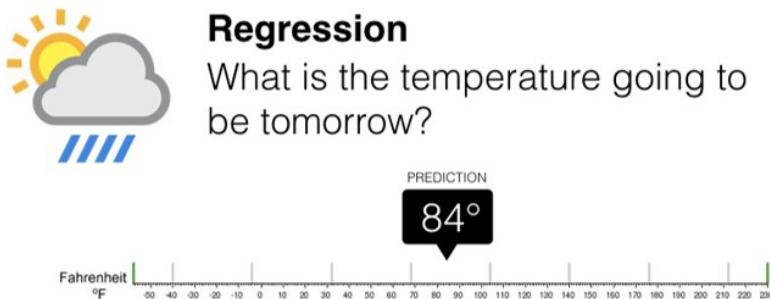

print(tf.__version__)

```

2.4.1

## Part 1: Boston Housing Price Prediction with Feed Forward Neural Networks

Let's start with using a fully-connected neural network to do predict housing prices. The following image highlights the difference between regression and classification (see part 2). Given an observation as input, **regression** outputs a continuous value (e.g., exact temperature) and classification outputs a class/category that the observation belongs to.

For the Boston housing dataset, we get 506 rows of data, with 13 features in each. Our task is to build a regression model that takes these 13 features as input and output a single value prediction of the "median value of owner-occupied homes (in \$1000)."

Now, we load the dataset. Loading the dataset returns four NumPy arrays:

- The `train_images` and `train_labels` arrays are the *training set*—the data the model uses to learn.
- The model is tested against the *test set*, the `test_images`, and `test_labels` arrays.

```
(train_features, train_labels), (test_features, test_labels) = keras.datasets.boston_housing.load_data()

# get per-feature statistics (mean, standard deviation) from the training set to normalize it
train_mean = np.mean(train_features, axis=0)
train_std = np.std(train_features, axis=0)
train_features = (train_features - train_mean) / train_std

Downloading data from https://storage.googleapis.com/tensorflow/tf-keras-datasets/boston_housing.npz?hl=en
57344/57026 [=====] - 0s 0us/step
```

## ▼ Build the model

Building the neural network requires configuring the layers of the model, then compiling the model. First we stack a few layers together using `keras.Sequential`. Next we configure the loss function, optimizer, and metrics to monitor. These are added during the model's compile step:

- *Loss function* - measures how accurate the model is during training, we want to minimize this with the optimizer.
- *Optimizer* - how the model is updated based on the data it sees and its loss function.
- *Metrics* - used to monitor the training and testing steps.

Let's build a network with 1 hidden layer of 20 neurons, and use mean squared error (MSE) as the loss function (most common one for regression problems):

```
def build_model():
    model = keras.Sequential([
        Dense(20, activation=tf.nn.relu, input_shape=[len(train_features[0])]),
        Dense(1)
    ])

    # for TF1
    #model.compile(optimizer=tf.train.AdamOptimizer(),
    # for TF2: tf.train.AdamOptimizer() => tf.optimizers.Adam()
    model.compile(optimizer=tf.optimizers.Adam(),
                  loss='mse',
                  metrics=['mae', 'mse'])
    return model
```

```
# this helps makes our output less verbose but still shows progress
class PrintDot(keras.callbacks.Callback):
    def on_epoch_end(self, epoch, logs):
        if epoch % 100 == 0: print('')
```

```
print('. ', end='')

model = build_model()
```

```
model.summary()
```

```
Model: "sequential"
```

Layer (type)	Output Shape	Param #
dense (Dense)	(None, 20)	280
dense_1 (Dense)	(None, 1)	21
=====		
Total params: 301		
Trainable params: 301		
Non-trainable params: 0		

## ▼ Train the model

Training the neural network model requires the following steps:

1. Feed the training data to the model—in this example, the `train_features` and `train_labels` arrays.
2. The model learns to associate features and labels.
3. We ask the model to make predictions about a test set—in this example, the `test_features` array. We verify that the predictions match the labels from the `test_labels` array.

To start training, call the `model.fit` method—the model is "fit" to the training data:

```
early_stop = keras.callbacks.EarlyStopping(monitor='val_loss', patience=50)
history = model.fit(train_features, train_labels, epochs=1000, verbose=0, validation_data=(test_features, test_labels),
                     callbacks=[early_stop, PrintDot()])

hist = pd.DataFrame(history.history)
hist['epoch'] = history.epoch
```

.....  
.....  
.....  
.....  
.....  
.....  
.....

```
hist.head()
```

	<b>loss</b>	<b>mae</b>	<b>mse</b>	<b>val_loss</b>	<b>val_mae</b>	<b>val_mse</b>	<b>epc</b>
<b>0</b>	587.850525	22.342070	587.850525	497.338501	21.296099	497.338501	
<b>1</b>	578.270081	22.107761	578.270081	488.346130	21.056395	488.346130	
<b>2</b>	568.495544	21.872797	568.495544	479.016754	20.807596	479.016754	
<b>3</b>	558.563049	21.626896	558.563049	469.127014	20.536999	469.127014	

```
# show RMSE measure to compare to Kaggle leaderboard on https://www.kaggle.com/c/b
rmse_final = np.sqrt(float(hist['val_mse'].tail(1)))
print()
print('Final Root Mean Square Error on validation set: {}'.format(round(rmse_final
```

Final Root Mean Square Error on validation set: 2.383

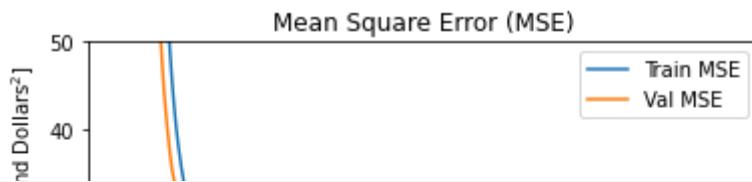

```
# show RMSE measure to compare to Kaggle leaderboard on https://www.kaggle.com/c/b
rmse_final = np.sqrt(float(hist['val_mae'].tail(1)))
print()
print('Final Root Mean Average Error on validation set: {}'.format(round(rmse_final
```

Final Root Mean Average Error on validation set: 1.441

Now, let's plot the loss function measure on the training and validation sets. The validation set is used to prevent overfitting ([learn more about it here](#)). However, because our network is small, the training converges without noticeably overfitting the data as the plot shows.

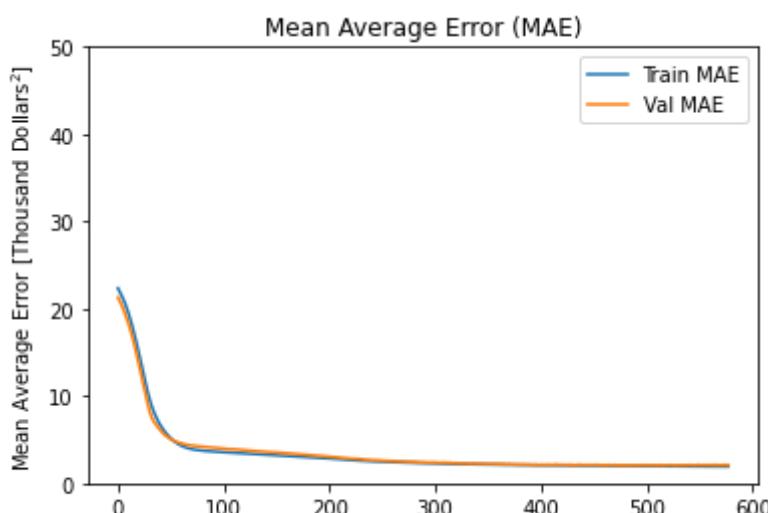

```
def plot_history():
    plt.figure()
    plt.xlabel('Epoch')
    plt.ylabel('Mean Square Error [Thousands $^2$]')
    plt.plot(hist['epoch'], hist['mse'], label='Train MSE')
    plt.plot(hist['epoch'], hist['val_mse'], label = 'Val MSE')
    plt.legend()
    plt.title("Mean Square Error (MSE)")
    plt.ylim([0,50])

plot_history()
```

```
def plot_history():
    plt.figure()
    plt.xlabel('Epoch')
    plt.ylabel('Mean Average Error [Thousand Dollars$^2]')
    plt.plot(hist['epoch'], hist['mae'], label='Train MAE')
    plt.plot(hist['epoch'], hist['val_mae'], label = 'Val MAE')
    plt.legend()
    plt.title("Mean Average Error (MAE)")
    plt.ylim([0,50])

plot_history()
```

Next, compare how the model performs on the test dataset:

```
print(model.metrics_names)

['loss', 'mae', 'mse']

test_features_norm = (test_features - train_mean) / train_std
loss, mae, mse = model.evaluate(test_features_norm, test_labels)
print('Loss on test set: {}'.format(round(loss, 3)))
print('Mean Average Error on test set: {}'.format(round(mae, 3)))
print('Mean Square Error on test set: {}'.format(round(mse, 3)))
rmse = np.sqrt(mse)
print('Root Mean Square Error on test set: {}'.format(round(rmse, 3)))
```

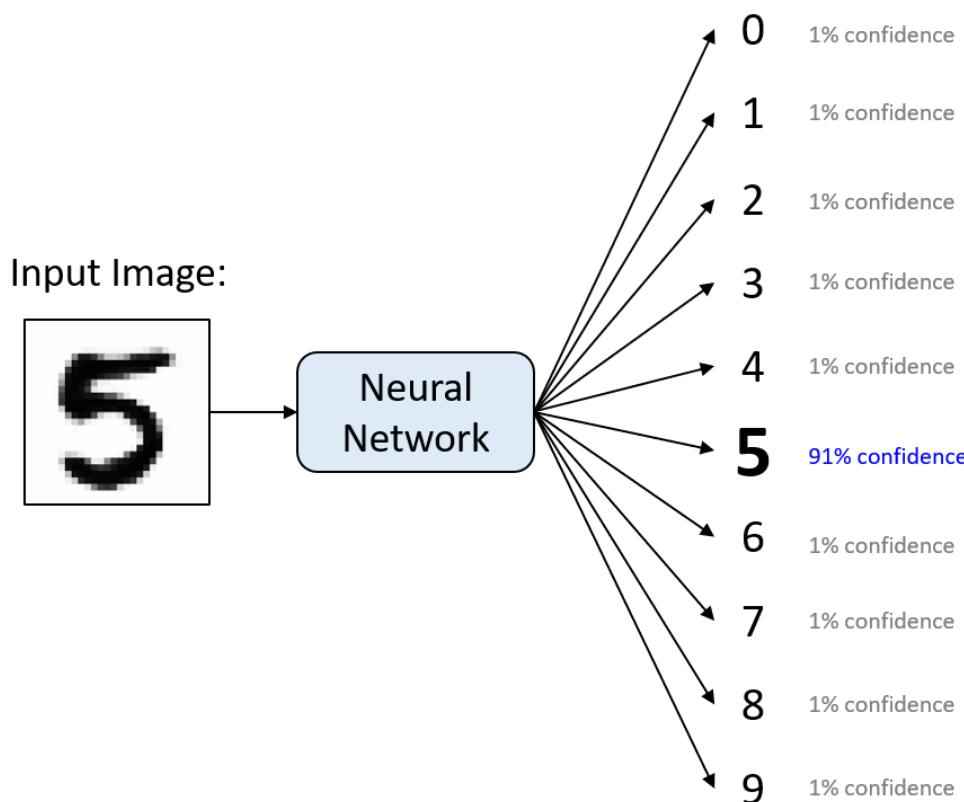

```
4/4 [=====] - 0s 4ms/step - loss: 18.3065 - mae: 2.6
Loss on test set: 18.306
Mean Average Error on test set: 2.686
Mean Square Error on test set: 18.306
Root Mean Square Error on test set: 4.279
```

Compare the RMSE measure you get to the [Kaggle leaderboard](#). An RMSE of 4.105 puts us in 24th place.

## Part 2: Classification of MNIST Dreams with Convolutional Neural Networks

Next, let's build a convolutional neural network (CNN) classifier to classify images of handwritten digits in the MNIST dataset with a twist where we test our classifier on high-resolution hand-written digits from outside the dataset.

The MNIST dataset contains 70,000 grayscale images of handwritten digits at a resolution of 28 by 28 pixels. The task is to take one of these images as input and predict the most likely digit contained in the image (along with a relative confidence in this prediction):

Now, we load the dataset. The images are 28x28 NumPy arrays, with pixel values ranging between 0 and 255. The *labels* are an array of integers, ranging from 0 to 9.

```
(train_images, train_labels), (test_images, test_labels) = keras.datasets.mnist.lo  
# reshape images to specify that it's a single channel  
train_images = train_images.reshape(train_images.shape[0], 28, 28, 1)  
test_images = test_images.reshape(test_images.shape[0], 28, 28, 1)
```

Downloading data from <https://storage.googleapis.com/tensorflow/tf-keras-data>

```
11493376/11490434 [=====] - 0s 0us/step
```

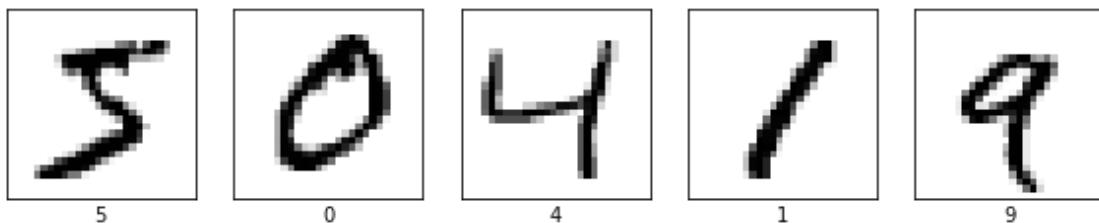

We scale these values to a range of 0 to 1 before feeding to the neural network model. For this, we divide the values by 255. It's important that the *training* set and the *testing* set are preprocessed in the same way:

```
def preprocess_images(imgs): # should work for both a single image and multiple images
    sample_img = imgs if len(imgs.shape) == 2 else imgs[0]
    assert sample_img.shape in [(28, 28, 1), (28, 28)], sample_img.shape # make sure
    return imgs / 255.0

train_images = preprocess_images(train_images)
test_images = preprocess_images(test_images)
```

Display the first 5 images from the *training* set and display the class name below each image. Verify that the data is in the correct format and we're ready to build and train the network.

```
plt.figure(figsize=(10,2))
for i in range(5):
    plt.subplot(1,5,i+1)
    plt.xticks([])
    plt.yticks([])
    plt.grid(False)
    plt.imshow(train_images[i].reshape(28, 28), cmap=plt.cm.binary)
    plt.xlabel(train_labels[i])
```

## ▼ Build the model

Building the neural network requires configuring the layers of the model, then compiling the model. In many cases, this can be reduced to simply stacking together layers:

```
model = keras.Sequential()
# 32 convolution filters used each of size 3x3
model.add(Conv2D(32, kernel_size=(3, 3), activation='relu', input_shape=(28, 28, 1))
# 64 convolution filters used each of size 3x3
model.add(Conv2D(64, (3, 3), activation='relu'))
# choose the best features via pooling
model.add(MaxPooling2D(pool_size=(2, 2)))
# randomly turn neurons on and off to improve convergence
model.add(Dropout(0.25))
```

```

# flatten since too many dimensions, we only want a classification output
model.add(Flatten())
# fully connected to get all relevant data
model.add(Dense(128, activation='relu'))
# one more dropout
model.add(Dropout(0.5))
# output a softmax to squash the matrix into output probabilities
model.add(Dense(10, activation='softmax'))

```

Before the model is ready for training, it needs a few more settings. These are added during the model's *compile* step:

- *Loss function* - measures how accurate the model is during training, we want to minimize this with the optimizer.
- *Optimizer* - how the model is updated based on the data it sees and its loss function.
- *Metrics* - used to monitor the training and testing steps. "accuracy" is the fraction of images that are correctly classified.

```
model.summary()
```

Model: "sequential\_1"

Layer (type)	Output Shape	Param #
<hr/>		
conv2d (Conv2D)	(None, 26, 26, 32)	320
conv2d_1 (Conv2D)	(None, 24, 24, 64)	18496
max_pooling2d (MaxPooling2D)	(None, 12, 12, 64)	0
dropout (Dropout)	(None, 12, 12, 64)	0
flatten (Flatten)	(None, 9216)	0
dense_2 (Dense)	(None, 128)	1179776
dropout_1 (Dropout)	(None, 128)	0
dense_3 (Dense)	(None, 10)	1290
<hr/>		
Total params: 1,199,882		
Trainable params: 1,199,882		
Non-trainable params: 0		

---

```

model.compile(optimizer=tf.optimizers.Adam(),
              loss='sparse_categorical_crossentropy',
              metrics=['accuracy'])

```

## ▼ Train the model

Training the neural network model requires the following steps:

1. Feed the training data to the model—in this example, the `train_images` and `train_labels` arrays.
2. The model learns to associate images and labels.
3. We ask the model to make predictions about a test set—in this example, the `test_images` array. We verify that the predictions match the labels from the `test_labels` array.

To start training, call the `model.fit` method—the model is "fit" to the training data:

```
history = model.fit(train_images, train_labels, epochs=5, validation_split = 0.1)

Epoch 1/5
1688/1688 [=====] - 11s 3ms/step - loss: 0.3720 - acc: 0.6860
Epoch 2/5
1688/1688 [=====] - 6s 3ms/step - loss: 0.0842 - acc: 0.9200
Epoch 3/5
1688/1688 [=====] - 5s 3ms/step - loss: 0.0678 - acc: 0.9400
Epoch 4/5
1688/1688 [=====] - 5s 3ms/step - loss: 0.0535 - acc: 0.9560
Epoch 5/5
1688/1688 [=====] - 6s 3ms/step - loss: 0.0418 - acc: 0.9680

print(model.metrics_names)

['loss', 'accuracy']
```

As the model trains, the loss and accuracy metrics are displayed. This model reaches an accuracy of about 98.68% on the training data.

```
hist = pd.DataFrame(history.history)
hist['epoch'] = history.epoch
```

```
hist.head()
```

	loss	accuracy	val_loss	val_accuracy	epoch
0	0.198095	0.940278	0.048189	0.986333	0
1	0.084753	0.975000	0.043236	0.988167	1
2	0.066670	0.979667	0.034934	0.990000	2
3	0.053950	0.983907	0.031506	0.990000	3
4	0.044473	0.985796	0.032814	0.991000	4

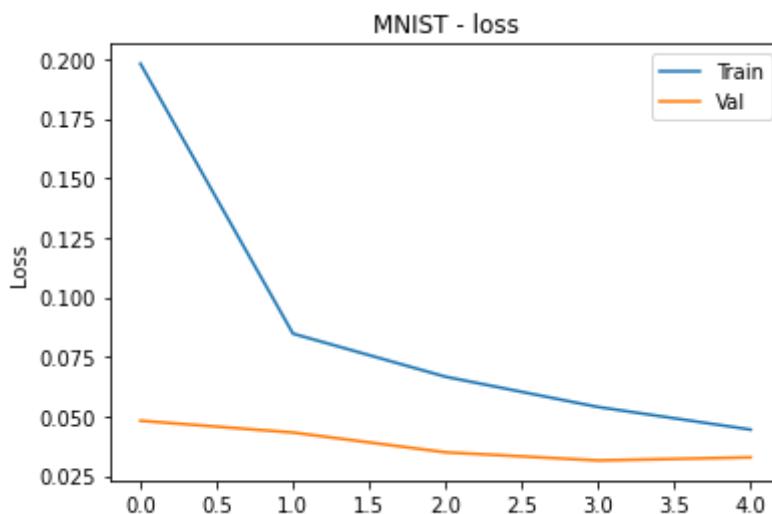

```
def plot_history():
```

```

plt.figure()
plt.xlabel('Epoch')
plt.ylabel('Loss')
plt.plot(hist['epoch'], hist['loss'], label='Train')
plt.plot(hist['epoch'], hist['val_loss'], label = 'Val')
plt.legend()
plt.title("MNIST - loss")
#plt.ylim([0,50])

plot_history()

```

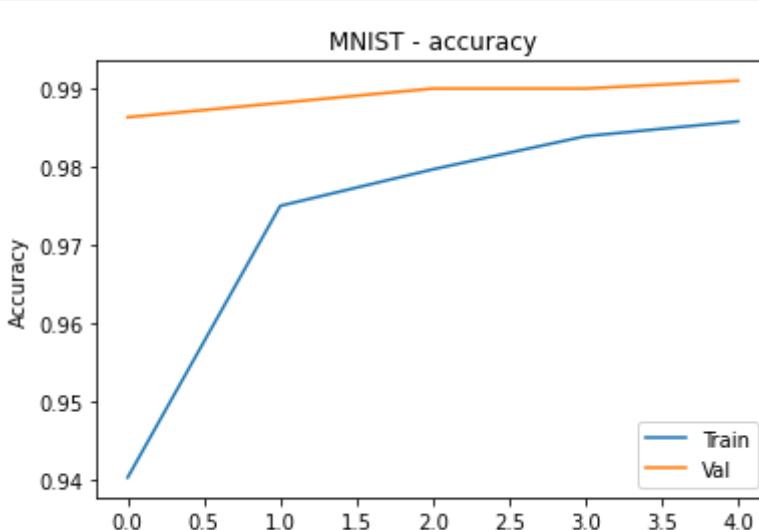

```

def plot_history():
    plt.figure()
    plt.xlabel('Epoch')
    plt.ylabel('Accuracy')
    plt.plot(hist['epoch'], hist['accuracy'], label='Train')
    plt.plot(hist['epoch'], hist['val_accuracy'], label = 'Val')
    plt.legend()
    plt.title("MNIST - accuracy")
    #plt.ylim([0,50])

plot_history()

```

## ▼ Evaluate accuracy

Next, compare how the model performs on the test dataset:

```
print(test_images.shape)
test_loss, test_acc = model.evaluate(test_images, test_labels)

print('MNIST - Test accuracy:', test_acc)

(10000, 28, 28, 1)
313/313 [=====] - 1s 2ms/step - loss: 0.0291 - accur
MNIST - Test accuracy: 0.9905999898910522
```

## ▼ Compare with ... after 5 epochs

```
(10000, 28, 28, 1) 313/313 [=====] - 1s 2ms/step - loss: 0.0302 -
accuracy: 0.9910

Test accuracy: 0.9909999966621399
```

Often times, the accuracy on the test dataset is a little less than the accuracy on the training dataset. This gap between training accuracy and test accuracy is an example of *overfitting*. In our case, the accuracy is better at 99.19%! This is, in part, due to successful regularization accomplished with the Dropout layers.

## ▼ Make predictions

With the model trained, we can use it to make predictions about some images. Let's step outside the MNIST dataset for that and go with the beautiful high-resolution images generated by a mixture of CPPN, GAN, VAE. See [great blog post by hardmaru](#) for the source data and a description of how these morphed animations are generated:

```

# Set common constants
this_repo_url = 'https://github.com/lexfridman/mit-deep-learning/raw/master/'
this_tutorial_url = this_repo_url + 'tutorial_deep_learning_basics'

mnist_dream_path = 'images/mnist_dream.mp4'

                color=color, lineType=line_type)
    y += 60

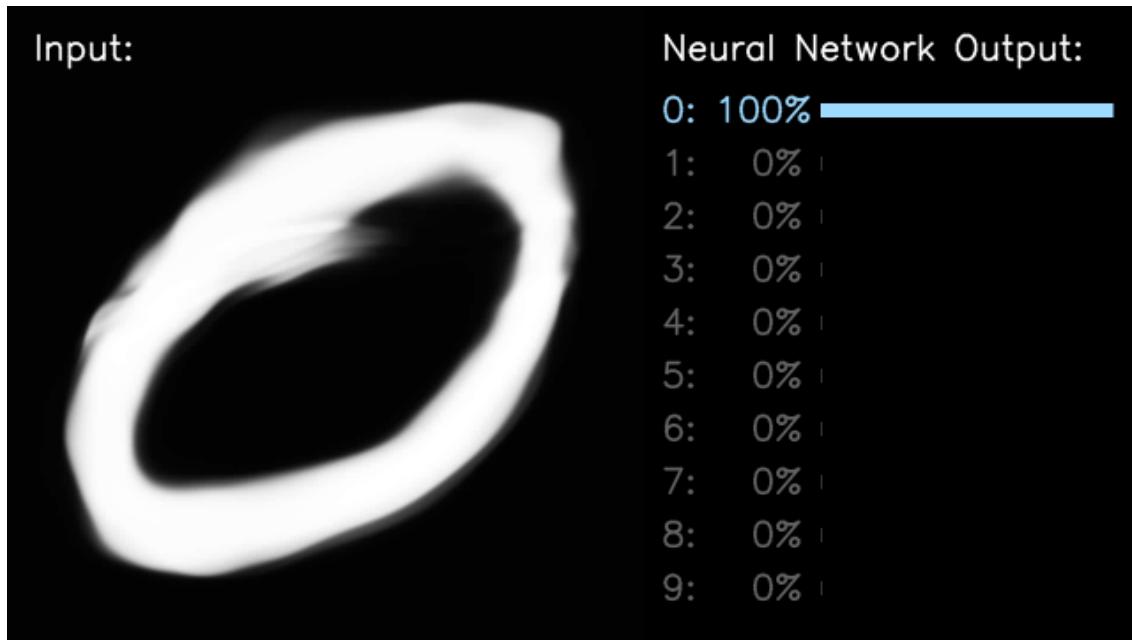

# if you don't want to save the output as a video, set this to False
save_video = True

if save_video:
    if vw is None:
        codec = cv2.VideoWriter_fourcc(*'DIVX')
        vid_width_height = img.shape[1], img.shape[0]
        vw = cv2.VideoWriter(mnist_prediction_path, codec, 30, vid_width_heigh
        # 15 fps above doesn't work robustly so we write frame twice at 30 fps
        vw.write(img)
        vw.write(img)

    # scale down image for display
    img_disp = cv2.resize(img, (0,0), fx=0.5, fy=0.5)
    cv2_imshow(img_disp)
    IPython.display.clear_output(wait=True)

cap.release()
if vw is not None:
    vw.release()

```

The above shows the prediction of the network by choosing the neuron with the highest output. While the output layer values add 1 to one, these do not reflect well-calibrated measures of "uncertainty". Often, the network is overly confident about the top choice that does not reflect a learned measure of probability. If everything ran correctly you should get an animation like this:

# DL Workflow — Learning/Training Types

- **Learning from scratch:**
- from **random initial parameters** (weights, ...)
  - from **previously trained** attempts.
- **Transfer learning** — is the improvement of learning in a new task through the transfer of knowledge from a related task that has already been learned.
- **Knowledge distillation** — learning is the process of transferring knowledge from a large model to a smaller one.
- **Federated learning** (also known as collaborative learning) is a machine learning technique that trains an algorithm across multiple decentralized edge devices or servers holding local data samples, without exchanging them.

# DL Workflow — Learning/Training Types

## — from scratch ... on datasets

**Learning from scratch** from **random initial** parameters (weights, ...) is very resource-demanding task.

Even for **MNIST** (**60K** images), it took a time to train the model up to the accuracy 80-90%. For a higher accuracy, more images would be required.

**DNN learns better** with a **higher volume** of data.

# DL Workflow — Learning/Training Types

## — from scratch ... on datasets

One more dataset with ancient Cyrillic letters ... from Kyiv

The screenshot shows a web browser window with the URL <https://www.kaggle.com/yoctoman/graffiti>. The browser's header includes navigation icons, a search bar, and a progress bar at 90%. The left sidebar of the Kaggle website has a menu with 'kaggle' at the top, followed by Home, Compete, Data (which is selected), Code, Communities, and Courses. The main content area displays a dataset titled 'Dataset' with the title 'Glyphs of Graffiti of St. Sophia Cathedral of Kyiv'. Below the title is the subtitle 'The Glagolitic and Cyrillic letters from the carved graffiti'. It shows a thumbnail image of a building with green roofs and some graffiti. A profile picture of 'yocotoman' and the text 'updated 2 years ago (Version 3)' are also visible. Below the main title, there is a navigation bar with links: Data, Tasks, Code (1), Discussion (1), Activity, Metadata, and Settings. Under the 'Introduction' section, there is a paragraph about the unique corpus of epigraphic monuments of St. Sophia of Kyiv and a photograph of ancient graffiti on a stone surface.

# DL Workflow — Learning/Training Types

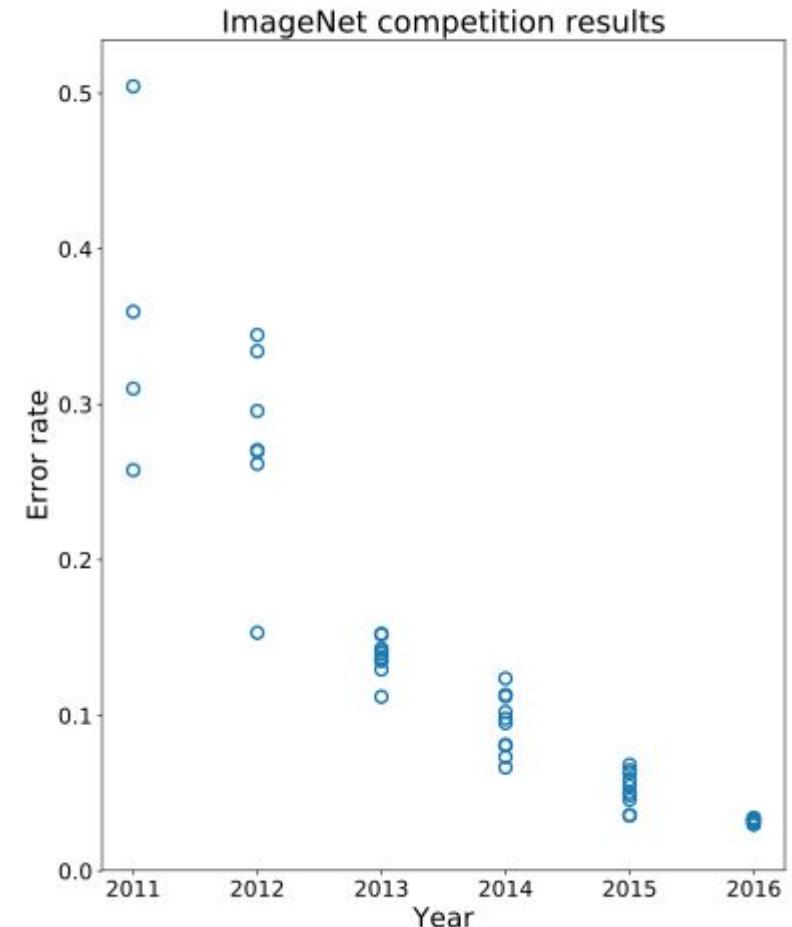

## — from scratch ... on Imagenet

**ImageNet** (<http://image-net.org>): 14,197,122 images into 21,841 subcategories into 27 subtrees.

To classify the images in ImageNet, many ML/DL models were developed. In 2017, one model achieved an error rate of 2.3%.

The screenshot shows the homepage of image-net.org. At the top is a standard browser header with back, forward, and search buttons. Below it is the ImageNet logo and a banner stating "14,197,122 images, 21841 synsets indexed". A navigation menu includes links for Explore, Download, Challenges, Publications, Updates, and About. Below the menu, a message says "Not logged in. Login | Signup". The main content area features a paragraph about ImageNet's organization and a link to learn more. At the bottom is a horizontal grid of nine small images related to trees and forests.

What do these images have in common? *Find out!*

# DL Workflow — Learning/Training Types

## — Transfer Learning

Transfer learning — is the improvement of learning in a new task through the transfer of knowledge from a related task that has already been learned.

### 1. Using a Pre-Trained Model

### 2. Training a Model to Reuse it

To solve task A you have limited data to train a DNN.  
One way: to find a related task B with an abundance of data.  
Train the DNN on task B and use the model as a starting point for solving task A.

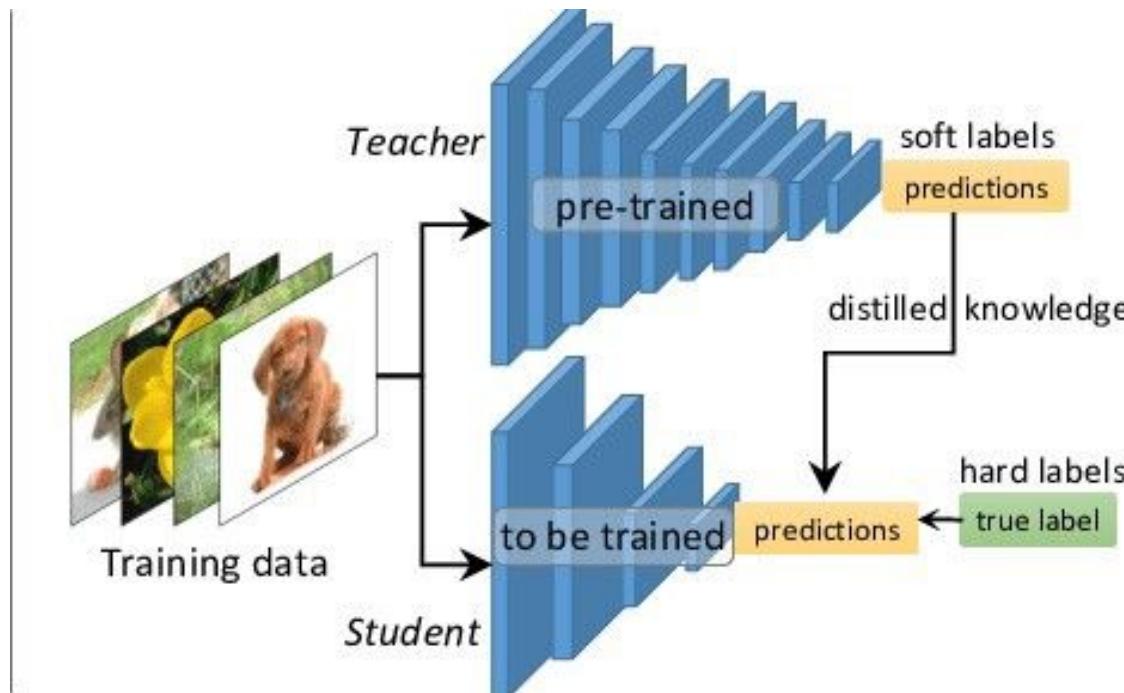

### 3. Feature Extraction

Another approach is to use DNN to find the best **representation** (most important features) of your problem, and use them.

# DL Workflow — Learning/Training Types - Knowledge Distillation

A small model is trained to mimic a pre-trained, larger model (or ensemble of models). This training setting is sometimes referred to as “teacher-student”, where the **large** model is the **teacher** and the **small** model is the **student**.

It has even been observed that classifiers **learn** much **faster** and more **reliably** if trained with the **outputs** of another classifier as **soft labels**, instead of from hard labels (ground truth data).

# DL Workflow — Learning/Training Types

## — Federated Learning

... is in contrast to

- traditional **centralized** learning techniques where all the **local** datasets are **uploaded to one server**,
- and some **classical decentralized** learning techniques where local data samples are identically distributed.

Step 1	Step 2	Step 3	Step 4
Central server chooses a statistical model to be trained	Central server transmits the initial model to several nodes	Nodes train the model locally with their own data	Central server pools model results and generate one global mode without accessing any data

# **DL Workflow**

-

## **Transfer Learning**

# **DEMO 3A: Learning from Scratch in TF2**

**DEMO\_3A\_Model\_from\_TF2\_Keras\_CNN\_2\_4\_6\_cifar10\_imageClassification.ipynb**

# DL Workflow — Transfer Learning

## Transfer learning

- in general sense: is the improvement of learning in a new task through the transfer of knowledge from a related task that has already been learned,
- in ML/DL context: it is an important technique of **knowledge transfer** from one to another **ML/DL task**.

## Examples:

- ◆ In software engineering: people use binary libraries to reuse the code.
- ◆ In ML/DL: the trained models contain the **algorithms**, the **data**, the **processing power**, and the **expert's domain knowledge**. All these need to be **transferred** to the **new model**. That's what the transfer learning provides.

# Transfer Learning — Model Sources

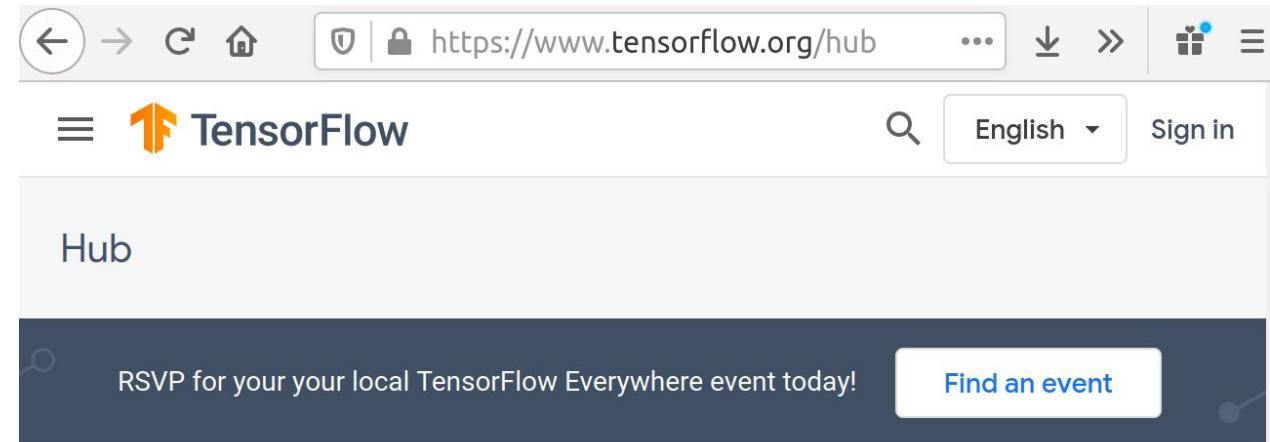

Pre-trained models can be found everywhere:

- from your **colleagues**,

- **github**,
- **Kaggle**,

...

but **Tensorflow Hub** is a the widest and easiest source of pre-trained and trustable DNN models.

TensorFlow Hub is a repository of trained machine learning models.

TensorFlow Hub is a repository of trained machine learning models ready for fine-tuning and deployable anywhere. Reuse trained models like BERT and Faster R-CNN with just a few lines of code.

```
!pip install --upgrade tensorflow-hub  
  
import tensorflow_hub as hub  
  
model = hub.KerasLayer("https://tfhub.dev/google/tf2-pretrained-bert-base/2")  
embeddings = model(["The rain", "mainly", "rained", "all", "the", "time"])
```

<https://www.tensorflow.org/hub>

## ▼ DEMO A - Introduction to TF Estimators

based on (C) Velayudham, Sakranha, TF Authors works

```
import tensorflow as tf
import pandas as pd
from sklearn.model_selection import train_test_split
from sklearn.preprocessing import StandardScaler
```

## ▼ Connect to Google Drive

```
from google.colab import drive
drive.mount('/content/drive')
```

Mounted at /content/drive

```
! cp /content/drive/MyDrive/2022_COLAB_NN/Lecture_06_TF2_Estimators_CNN_RockPaperS
! ls

drive  sample_data  winequality-white.csv
```

## ▼ Loading Data

```
data_url='winequality-white.csv'
data=pd.read_csv(data_url,delimiter=';')
data.head()
```

	fixed acidity	volatile acidity	citric acid	residual sugar	chlorides	free sulfur dioxide	total sulfur dioxide	density
0	7.0	0.27	0.36	20.7	0.045	45.0	170.0	1.0010
1	6.3	0.30	0.34	1.6	0.049	14.0	132.0	0.9940
2	8.1	0.28	0.40	6.9	0.050	30.0	97.0	0.9951
3	7.2	0.23	0.32	8.5	0.058	47.0	186.0	0.9956

## ▼ Selecting Features/Labels

```
x = data.iloc[:, :-1]
y = data.iloc[:, -1]
```

```
sc = StandardScaler()
x = sc.fit_transform(x)
```

## ▼ Creating datasets

```
xtrain, xtest, ytrain, ytest = train_test_split(x, y, test_size = 0.3, random_state = 42)

input_shape = xtrain.shape[1]
```

## ▼ Defining simple FCN Keras model

```
small_model = tf.keras.models.Sequential([
    tf.keras.layers.Dense(64, activation = 'relu',
                          input_shape = (input_shape,)),
    tf.keras.layers.Dense(1)
])

small_model.compile(loss = 'mse', optimizer = 'adam')
```

```
def input_fn(features, labels, training = True, batch_size = 32):
    #converts inputs to a dataset
    dataset = tf.data.Dataset.from_tensor_slices(({'dense_input':features},labels))

    #shuffle and repeat in a training mode
    if training:
        dataset = dataset.shuffle(1000).repeat()

    #giving inputs in batch for training
    return dataset.batch(batch_size)
```

## ▼ Convert Keras model to Estimator

```
keras_small_estimator = tf.keras.estimator.model_to_estimator(
    keras_model = small_model, model_dir = 'keras_small_classifier')

/usr/local/lib/python3.7/dist-packages/keras/backend.py:450: UserWarning: `tf
  warnings.warn(``tf.keras.backend.set_learning_phase`` is deprecated and '
```

## ▼ Train

```
keras_small_estimator.train(input_fn = lambda:input_fn(xtrain, ytrain), steps = 20

## ▼ DEMO B - Create DNN Model by TF Estimators

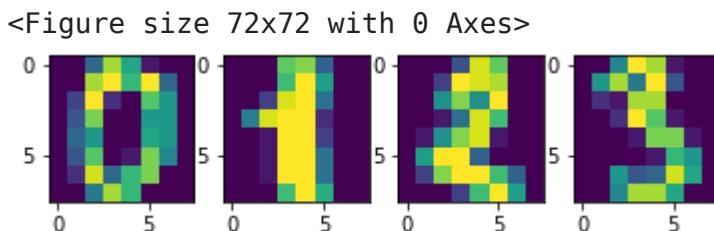

based on (C) Velayudham, Sakranha, TF Authors works

```
import tensorflow as tf
```

## ▼ Loading Data

```
from sklearn import datasets  
digits = datasets.load_digits()
```

```
#plotting sample image  
import matplotlib.pyplot as plt  
plt.figure(figsize=(1,1))  
fig, ax = plt.subplots(1,4)  
ax[0].imshow(digits.images[0])  
ax[1].imshow(digits.images[1])  
ax[2].imshow(digits.images[2])  
ax[3].imshow(digits.images[3])  
plt.show()
```

## ▼ Preprocessing Data

```
# reshape the data to two dimensions  
n_samples = len(digits.images)  
data = digits.images.reshape((n_samples, -1))  
data.shape
```

(1797, 64)

```
# split into training/testing  
from sklearn.model_selection import train_test_split  
X_train, X_test, y_train, y_test = train_test_split(  
    data, digits.target, test_size=0.05, shuffle=False)
```

## ▼ Defining Input Function

```
# create column names for our model input function
columns = ['p_'+ str(i) for i in range(1,65)]\n\nfeature_columns = []
for col in columns:
    feature_columns.append(tf.feature_column.numeric_column(key = col))\n\n\ndef input_fn(features, labels, training = True, batch_size = 32):
    #converts inputs to a dataset
    dataset = tf.data.Dataset.from_tensor_slices((dict(features),labels))
    #shuffle and repeat in a training mode
    if training:
        dataset=dataset.shuffle(1000).repeat()
    #giving inputs in batches for training
    return dataset.batch(batch_size)
```

## ▼ Create DNNClassifier Estimator instance

```
classifier = tf.estimator.DNNClassifier(hidden_units = [256, 128, 64],
                                         feature_columns = feature_columns,
                                         optimizer = 'Adagrad',
                                         n_classes = 10,
                                         model_dir = 'classifier')
```

## ▼ Adding extra hidden layer

## ▼ without Dropout

```
classifier = tf.estimator.DNNClassifier(hidden_units = [256, 128, 64, 32],
                                         feature_columns = feature_columns,

## DEMO D - Transfer Learning - Rock Paper Scissors (using NASNetMobile)

based on (C) Ng, Moroney, Mingxing Tan, Quoc V. Le, Rawlani, and **Oleksii Trekhleb** ("Our Man in Uber":))

### Experiment overview

In this experiment we will build a [Convolutional Neural Network](#) (CNN) model using [Tensorflow](#) to recognize Rock-Paper-Scissors signs (gestures) on the photo.

Instead of training the model from scratch we will use **transfer learning** method (look at DEMOs in previous lectures) a family of [TF2-Keras-Applications](#) models. Here we will actually use NASNetMobile and other models which are pre-trained on the [ImageNet](#) dataset, a large dataset of 1.4M images and 1000 classes of web images.

### Importing dependencies

```
import tensorflow as tf
import tensorflow_datasets as tfds
import matplotlib.pyplot as plt
import numpy as np
import platform
import datetime
import os
import math
import random

print('Python version:', platform.python_version())
print('Tensorflow version:', tf.__version__)
print('Keras version:', tf.keras.__version__)
```

```
Python version: 3.7.14
Tensorflow version: 2.8.2
Keras version: 2.8.0
```

### Configuring TensorBoard

We will use TensorBoard as a helper to debug the model training process.

```
# Load the TensorBoard notebook extension.
```

```
# %reload_ext tensorboard
%load_ext tensorboard

# Clear any logs from previous runs.
!rm -rf ./logs/
```

## ▼ Dataset - Example

We will download Rock-Paper-Scissors dataset from [TensorFlow Datasets](#) collection. To do that we loaded a `tensorflow_datasets` module.

`tensorflow_datasets` defines a collection of datasets ready-to-use with TensorFlow.

Each dataset is defined as a [`tfds.core.DatasetBuilder`](#), which encapsulates the logic to download the dataset and construct an input pipeline, as well as contains the dataset documentation (version, splits, number of examples, etc.).

```

```

We will use the classic dataset by Moroney:

- Title: rock\_paper\_scissors
- Description: Images of hands playing rock, paper, scissor game.
- Homepage: <http://laurencemoroney.com/rock-paper-scissors-dataset>
- Source code: `tfds.image_classification.RockPaperScissors`
- Versions: 3.0.0 (default): New split API (<https://tensorflow.org/datasets/splits>)
- Download size: 219.53 MiB
- Image Examples:

Rock

## ▼ Loading the dataset

```
DATASET_NAME = 'rock_paper_scissors'

(dataset_train_raw, dataset_test_raw), dataset_info = tfds.load(
    name=DATASET_NAME,
    data_dir='tmp',
    with_info=True,
    as_supervised=True,
    split=[tfds.Split.TRAIN, tfds.Split.TEST],
)
```

## ▼ Data augmentation

One of the way to fight the [model overfitting](#) and to generalize the model to a broader set of examples is to augment the training data.

As you saw from the previous section all training examples have a white background and vertically positioned right hands. But what if the image with the hand will be horizontally positioned or what if the background will not be that bright. What if instead of a right hand the model will see a left hand. To make our model a little bit more universal we're going to flip and rotate images and also to adjust background colors.

You may read more about a [Simple and efficient data augmentations using the Tensorflow tf.Data and Dataset API](#).

```
200 | [ ] 200 | [ ] 200 | [ ] 200 | [ ] 200 | [ ]
```

```
def augment_flip(image: tf.Tensor) -> tf.Tensor:
    image = tf.image.random_flip_left_right(image)
    image = tf.image.random_flip_up_down(image)
    return image
```

```
| [ ] | [ ] | [ ] | [ ] | [ ] | [ ] | [ ] | [ ] | [ ] | [ ] |
```

```
def augment_color(image: tf.Tensor) -> tf.Tensor:
    image = tf.image.random_hue(image, max_delta=0.08)
    image = tf.image.random_saturation(image, lower=0.7, upper=1.3)
    image = tf.image.random_brightness(image, 0.05)
    image = tf.image.random_contrast(image, lower=0.8, upper=1)
    image = tf.clip_by_value(image, clip_value_min=0, clip_value_max=1)
    return image
```

```
def augment_rotation(image: tf.Tensor) -> tf.Tensor:
    # Rotate 0, 90, 180, 270 degrees
    return tf.image.rot90(
        image,
        tf.random.uniform(shape=[], minval=0, maxval=4, dtype=tf.int32)
    )
```

```
def augment_inversion(image: tf.Tensor) -> tf.Tensor:
    random = tf.random.uniform(shape=[], minval=0, maxval=1)
    if random > 0.5:
        image = tf.math.multiply(image, -1)
        image = tf.math.add(image, 1)
    return image
```

```
def augment_zoom(image: tf.Tensor, min_zoom=0.8, max_zoom=1.0) -> tf.Tensor:
    image_width, image_height, image_colors = image.shape
    crop_size = (image_width, image_height)

    # Generate crop settings, ranging from a 1% to 20% crop.
```

```
scales = list(np.arange(min_zoom, max_zoom, 0.01))
boxes = np.zeros((len(scales), 4))

for i, scale in enumerate(scales):
    x1 = y1 = 0.5 - (0.5 * scale)
    x2 = y2 = 0.5 + (0.5 * scale)
    boxes[i] = [x1, y1, x2, y2]

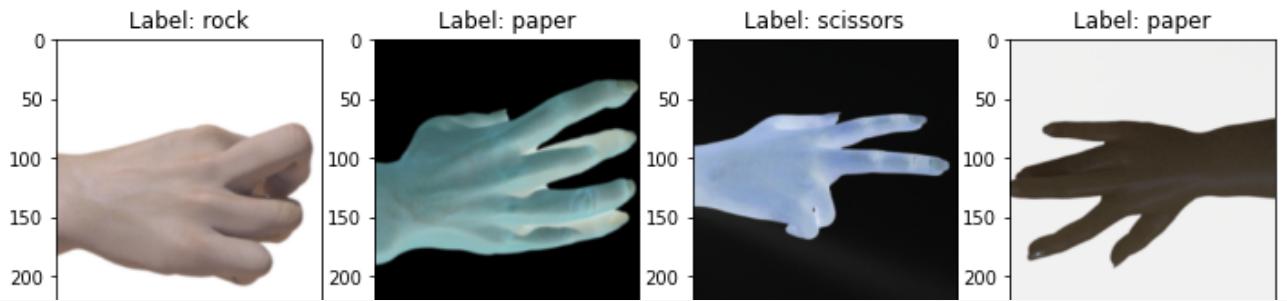

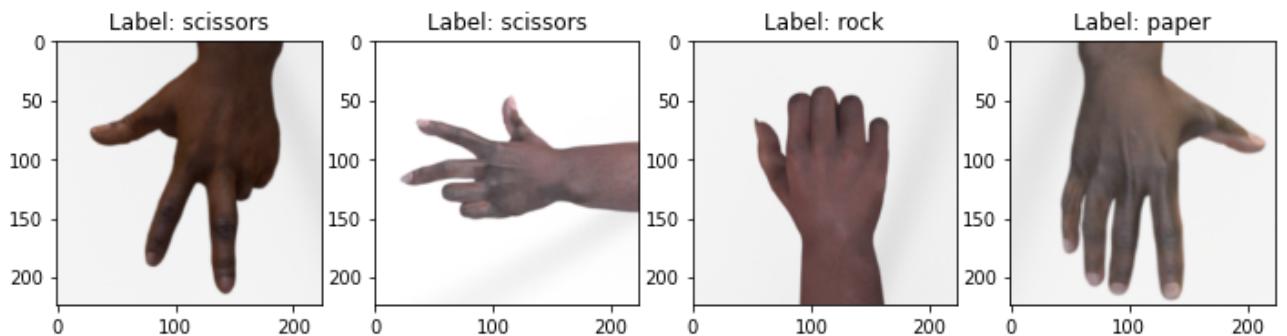

def random_crop(img):
    # Create different crops for an image
    crops = tf.image.crop_and_resize(
        [img],
        boxes=boxes,
        box_indices=np.zeros(len(scales)),
        crop_size=crop_size
    )
    # Return a random crop
    return crops[tf.random.uniform(shape=[], minval=0, maxval=len(scales), dtype=tf.float32)

# Only apply cropping 50% of the time
return tf.cond(choice < 0.5, lambda: image, lambda: random_crop(image))
```

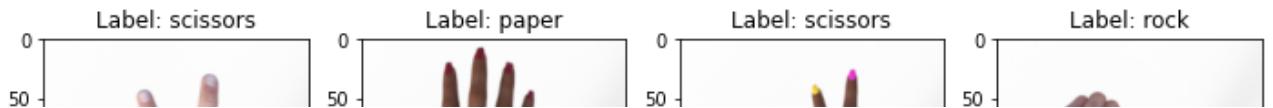

```
def augment_data(image, label):
    image = augment_flip(image)
    image = augment_color(image)
    image = augment_rotation(image)
    image = augment_zoom(image)
    image = augment_inversion(image)
    return image, label
```

```
dataset_train_augmented = dataset_train.map(augment_data)
```

```
# Explore augmented training dataset.
preview_dataset(dataset_train_augmented)
```

```
# Explore test dataset.  
preview_dataset(dataset_test)
```

## ▼ Data shuffling and batching

We don't want our model to learn anything from the order or grouping of the images in the dataset. To avoid that we will shuffle the training examples. Also we're going to split the training set by batches to speed up training process and make it less memory consuming.

```
BATCH_SIZE = 800

dataset_train_augmented_shuffled = dataset_train_augmented.shuffle(
    buffer_size=NUM_TRAIN_EXAMPLES
)

dataset_train_augmented_shuffled = dataset_train_augmented.batch(
    batch_size=BATCH_SIZE
)

# Prefetch will enable the input pipeline to asynchronously fetch batches while yo
dataset_train_augmented_shuffled = dataset_train_augmented_shuffled.prefetch(
    buffer_size=tf.data.experimental.AUTOTUNE
)

dataset_test_shuffled = dataset_test.batch(BATCH_SIZE)
|   |   |   |   |   |   |   |   |   |
print(dataset_train_augmented_shuffled)
print(dataset_test_shuffled)

<PrefetchDataset element_spec=(TensorSpec(shape=(None, 224, 224, 3), dtype=tf
<BatchDataset element_spec=(TensorSpec(shape=(None, 224, 224, 3), dtype=tf.fl
```

```
<input type="button" value="<"/> <input type="button" value=">"/>
```

```
# Debugging the batches using conversion to Numpy arrays.
batches = tfds.as_numpy(dataset_train_augmented_shuffled)
for batch in batches:
    image_batch, label_batch = batch
    print('Label batch shape:', label_batch.shape, '\n')
    print('Image batch shape:', image_batch.shape, '\n')
    print('Label batch:', label_batch, '\n')

    for batch_item_index in range(len(image_batch)):
        print('First batch image:', image_batch[batch_item_index], '\n')
        plt.imshow(image_batch[batch_item_index])
        plt.show()
        # Break to shorten the output.
        break
    # Break to shorten the output.
    break
```

## ▼ Creating the model

## ▼ Loading model

We don't want to use the top classification layer of the pre-trained model as it contains 1000 classes when we need only 3 (`rock`, `paper` and `scissors`). We will specify that by setting a `include_top` parameter to `False`.

You may read more about Keras models on [Keras Documentation](#)

```
base_model = tf.keras.applications.NASNetMobile(
    input_shape=INPUT_IMG_SHAPE,
    include_top=False,
    weights='imagenet',
    pooling='avg'
)
```

```
Downloading data from https://storage.googleapis.com/tensorflow/keras-applications/imagenet/
19996672/19993432 [=====] - 1s 0us/step
20004864/19993432 [=====] - 1s 0us/step
```

```
# Freezing the base model since we don't want to re-train it.
# We're only interesting in its feature extraction.
base_model.trainable = False
```

```
base_model.summary()
```

## ▼ Model fine tuning

We may try to unfreeze some of the top layers of the `base_model` and to train it a little bit more so to adjust top layers to our Rock-Paper-Scissors dataset.

```
# Un-freeze the top layers of the model  
base_model.trainable = True  
  
print("Number of layers in the base model: ", len(base_model.layers))
```

Number of layers in the base model: 770

```
# Fine tune from this layer onwards.  
# fine_tune_at = 149 # MobileNetV2  
fine_tune_at = 752  
  
# Freeze all the layers before the `fine_tune_at` layer  
for layer in base_model.layers[:fine_tune_at]:  
    layer.trainable = False  
  
# Compile the model using a much-lower training rate.  
adam_optimizer = tf.keras.optimizers.Adam(learning_rate=0.0001)  
rmsprop_optimizer = tf.keras.optimizers.RMSprop(learning_rate=0.0001)  
model.compile(  
    optimizer = rmsprop_optimizer,  
    loss=tf.keras.losses.sparse_categorical_crossentropy,  
    metrics=['accuracy'])  
  
model.summary()
```

# Lecture 8 - DEMO C - TPU - Deep Learning Model

## Deployment Example - MNIST WebApp (Flask + Google Colab)

based on (C) Tensorflow Authors Team, Parsaniya, Heaton, Jadhav and other works

### ▼ Connect to Google Drive

```
from google.colab import drive  
drive.mount('/content/drive')
```

Mounted at /content/drive

### ▼ Go to Project Folder at Google Drive and Check It

```
%cd 'drive/MyDrive/2022_COLAB_NN/Lecture_07_DL_Web-app'  
! ls
```

```
/content/drive/MyDrive/2022_COLAB_NN/Lecture_07_DL_Web-app  
generated_image MNIST_test_images  
Lecture_07_DL_Web-app.zip model  
Lecture_07_MNIST_DEMO_A_web_app_CPU_EMPTY.ipynb static  
Lecture_07_MNIST_DEMO_B_web_app_GPU_EMPTY.ipynb templates  
Lecture_07_MNIST_DEMO_C_web_app_TPU_EMPTY.ipynb uploads
```

### ▼ Install Flask

```
!pip install flask-ngrok
```

```
